Two types of deverbal nominalization in Northern Paiute

Maziar Toosarvandani

September 19, 2013

Abstract

Why do nominalizations mean what they do? I investigate two deverbal nominalizers in Northern Paiute (Uto-Aztecan, Numic: Western United States), -na and -di, both of which can create nominalizations that describe either an event (like the Poss-ing gerund in English) or an individual (like agent nominalizations with -er). I propose a syntax and semantics for these deverbal nominalizations that accounts for their interpretive variability. On the syntax side, I argue that -na and -di overtly realize the nominal functional head that canonically assigns case to possessors when this head takes a vP complement. On the semantics side, I propose that Northern Paiute has operators that abstract over a variable inside the nominalization. This accounts for the meanings that nominalizations in Northern Paiute have, and it highlights their relationship to nominalization patterns in other languages.

1 Introduction

Northern Paiute — a Uto-Aztecan language belonging to the Numic branch, spoken across the western United States — has two types of deverbal nominalization that can describe either events or individuals.1 When the nominalizer suffixes -na or -di attach to a verb, they create nominalizations

---

1 I thank Grace Dick, Leona Dick, Morris Jack, Elaine Lundy, Edith McCann, Meg McDonald, and Madeline Stevens for teaching me about their language. I am also grateful to Rebecca Cover for our early discussions of the Northern Paiute data, as well as to Rajesh Bhatt, Annahita Farudi, Andrew Garrett, Michael Houser, Kyle Johnson, Line Mikkelsen, Tom Roeper, Andrés Salanova, Tim Thornes, and audiences at Cornell University, McGill University, the Massachusetts Institute of Technology, Stanford University, the University of California (Berkeley, Los Angeles, and Santa Cruz), the University of Massachusetts, Amherst, and the University of Ottawa for their very helpful suggestions and questions.

The fieldwork for this paper was supported by an American Council of Learned Societies New Faculty Fellowship, as well as a Jacobs Research Fund Grant (Whatcom Museum Foundation, Bellingham, Washington), Phillips Fund Grant (American Philosophical Society, Philadelphia), a Grant in Great Basin Studies from the Sven and Astrid Liljeblad Endowment Fund (University of Nevada, Reno), and a grant from the Survey of California and Other Indian Languages (University of California, Berkeley). This research was also assisted by a New Faculty Fellowship from the American Council of Learned Societies, funded by the Andrew W. Mellon Foundation.

1 Northern Paiute is comprised of several closely related dialects that are spoken across and immediately adjacent to the Great Basin (Babel et al. 2012). Most of the data presented here come from my own fieldwork on the Mono Lake variety, spoken at Mono Lake in eastern California and immediately to the north in Bridgeport and Coleville,
that can refer to the event described by the verb, as in (1a) and (2a). But when one of the verb’s arguments is gapped, they create nominalizations that describe that individual, as in (1b) and (2b).

(1) a. Ni- i- a=bb auma-wi -nni --na
    1SG.NOM 4. GEN= rain-STAT-NMLZ hear
    ‘I hear it raining.’ (elicitation, MS, BP37-1-s, 6)

   b. I=saa-na
    1SG. GEN=cook-NMLZ burn-PUNC
    ‘What I was cooking burned.’ (elicitation, EM, BP32-9-s, 15)

(2) a. Ni -i- pauma-wi -nni --di -
    1SG. NOM rain-STAT-NMLZ hear
    ‘I hear it raining.’ (elicitation, MS, BP37-1-s, 5)

   b. Su=kutsu patsa-di -
    DEF. NOM=cow kill. SG-NMLZ go-PUNC
    ‘The one who killed the cow left.’ (elicitation, EM, BP37-1-s, 16)

In (1b), the patient of the verb saa ‘cook’ is gapped, so the nominalization describes the individual that the speaker cooks. In (2b), the agent of the verb patsa ‘kill (sg.)’ is gapped, so the nominalization describes the individual that kills the cow.

This semantic variability is surprising when we compare the nominalization patterns in (1a–b) and (2a–b) to structurally similar ones in English. The POSS-ing gerund, in Abney’s (1987) terms, must describe an event (3a); it cannot refer to the individual corresponding to an agent (3b) or patient (3c) argument.

(3) a. I witnessed Caesar’s burning the city.

   b. *Burning the city was arrested.
      Intended: ‘The one who burnt the city was arrested.’

   c. *Caesar’s burning was rebuilt within the year.
      Intended: ‘What Caesar burnt was rebuilt within the year.’

California and Sweetwater, Nevada. Additional data comes from the Burns, Oregon variety (Thornes 2003), and to a lesser extent the McDermitt, Nevada variety (Snapp et al. 1982) and the Bannock variety spoken at Fort Hall, Idaho (Liljeblad 1966). For all dialects of Northern Paiute, there are probably no more than 300 fluent speakers today (Golla 2011:174), and for the Mono Lake dialect, there are around five speakers.

2 Each example from my own fieldwork is annotated with its type (dialogue, elicitation, narrative, or prompted narrative), the speaker’s initials, the identification number for its source (starting with BP), and its location in the source (either a line number or timestamp). Examples from other sources receive the usual parenthetical citation.

I use the following abbreviations in this paper: ACC = accusative, APPL = applicative, DEF = definite, DEM = demonstrative, DIM = diminutive, DUR = durative, EMPH = emphatic particle, EXCL = exclusive, FOC = focus prefix, GEN = genitive, INCH = inchoative, INCL = inclusive, IND = indicative, IP = instrumental prefix, IRR = irrealis, LOC = locatival postposition, MOD = modal particle, MOT = motion suffix, NEG = negation, NMLZ = nominalizer, NOM = nominative, NSP = nonspecific patient, PASS = passive, PL = plural, PLUR = pluactional, PRF = perfect, PRO = resumptive pronoun, PROSP = prospective aspect, PTC = discourse particle, REFL = genitive reflexive anaphor, SBJ = subject, SBJV = subjunctive, SEQ = sequential marker, SG = singular, STAT = stative aspect, TNS = ‘general tense’ (Thornes 2003:398).
Instead, English uses a different series of nominalizers to describe individuals. For instance, the \(-er\) suffix creates nominalizations that pick out the external argument of the verb, as in (4a) (Rappaport Hovav and Levin 1992). It is not able to create event-denoting nominalizations (4b). \(^3\)

(4)  
(a) The seller of counterfeit stock was jailed.  
(b) * I witnessed the seller of counterfeit stock.  

Intended: ‘I witnessed the selling of counterfeit stock.’

Why do the two types of deverbal nominalization in Northern Paiute permit both an event and an individual interpretation, when their correlates in English do not? In this paper, I give a syntax and semantics that accounts for this interpretive variability in Northern Paiute.

I start by exploring the syntax of deverbal nominalizations in Northern Paiute. Assuming that they contain a verbal projection embedded inside a nominal one (Bresnan 1997, Borsley and Kornttil 2000), I propose in §2 that the nominalizers \(-na\) and \(-di\) realize the nominal functional category that canonically assigns case to possessors, when it embeds a \(vP\):

\[
\begin{array}{ll}
\text{(5) a.} & \text{DP} \\
& \text{D} \\
& \text{PossP} \\
& \text{DP} \\
& \text{Poss'} \\
& \text{vP} \\
& \text{Poss} \\
& \ldots V \\
& \text{-na}
\end{array}
\begin{array}{ll}
\text{b.} & \text{DP} \\
& \text{D} \\
& \text{PossP} \\
& \text{vP} \\
& \text{Poss} \\
& \ldots V \\
& \text{-di}
\end{array}
\]

This nominal head, which I call \(\text{Poss}\), is the analogue of \(\text{T(ense)}\) in the verbal domain (Szabolcsi 1983, 1987, 1994, Cardinaletti 1998, Alexiadou et al. 2007:556–575). Since these nominalizations do not contain \(T\), nominative case is not available inside them. The \(-na\) nominalizer does make an additional genitive case available to the \(\text{DP}\) in the specifier position it projects. The \(-di\) nominalizer, however, is defective and does not project a specifier position or assign genitive case, leaving one case too few in the nominalizations it creates.

With these structures in hand, I then turn to the semantics of deverbal nominalization in Northern Paiute. In §3, I show that the event interpretation of nominalizations with \(-na\) comes for free in a way. Since the nominalizer makes available a genitive case to the highest argument of the verb, all its individual-type arguments can be saturated. Assuming that the verb also takes an event argument (Davidson 1967), only the event argument will then be left unsaturated, so that the nominalization

\(^3\)The exception is derived nominals that exhibit the process-result ambiguity (Grimshaw 1990:46–63). A derived nominal like \(\text{destruction}\) can describe an event of destruction, or it can describe the result of that event. Observe, however, that the result is not itself an argument of the verb \(\text{destroy}\)—it describes not the thing destroyed but the effects of the destruction. In addition, as Borer (2003) observes, the so-called result interpretation is not always so easily characterized as the result of an event. For instance, under their ‘result’ meanings, \(\text{obstruction}\) describes something like the causer of an event, \(\text{administration}\) the agent, and \(\text{entrance}\) a location. The precise nature of the result interpretation depends on a variety of factors, including the Aktionsart of the nominalized verb and whether it is a verb of creation (Asher 1993:150–159, Pustejovsky 1995:170f.).

This is very different from the semantic variability exhibited by the two types of deverbal nominalization I describe in Northern Paiute, which as I will shortly show always describe an argument of the embedded verb under their individual interpretations.
describes an event. On the other hand, the individual interpretation arises because Northern Paiute has operators inside the DP that can abstract over the variable contributed by a (sometimes null) resumptive pronoun. These pronouns are projected syntactically, creating a gap in direct object position, as in (2a), or in the argument position of a postposition, as in (6).

(6) \[ Ka=i=naa’ a \quad pi-kuba \quad kati-na \quad nii \quad timi-dua. \]

\[ \text{DEF.ACC=1SG.GEN=father PRO-LOC sit-NMLZ 1SG.NOM buy-IRR} \]

‘I will buy the one my father is sitting on.’ (elicitation, MS, BP34-5-s, 6)

Because of the antilocality property of resumptive pronouns (Borer 1984, McCloskey 1990), nominalizations with -na can describe any individual that is not the highest argument of the embedded verb (the surface subject, in other words).

In contrast, when nominalizations created by -di describe an individual, they invariably describe the highest argument of the verb. This might be the agent, as in (2b) above, though it can also be the patient of a passive or unaccusative verb, as in (7a–b), or the sole argument of a stative predicate, as in (7c).

(7) a. \[ Su=na-gwitama-di \quad wadzi-mia-hu. \]

\[ \text{DEF.NOM=PASS-lock.up-NMLZ hide-go-PUNC} \]

‘The one who should be locked up ran away.’ (elicitation, MS, BP34-4-s, 24)

b. \[ Ka=idziggwi \quad ka=kwopika-winni-di \quad nii \quad ki’a. \]

\[ \text{DEF.ACC=blanket DEF.ACC=shiver-STAT-NMLZ 1SG.NOM give.DUR} \]

‘I gave the blanket to the one who is shivering.’ (elicitation, MS, BP34-3-s, 28)

c. \[ Su=nana \quad ka=patsiponoa-di-ma \quad kati-hu. \]

\[ \text{DEF.NOM=man DEF.ACC=be.round-NMLZ-LOC sit-PUNC} \]

‘The man sat on the thing that is round.’ (elicitation, EM, BP34-3-s, 34)

In §4, I propose that because these nominalizations do not contain nominative case — and because genitive case is also not available — the highest argument of the verb must be realized as a phonologically null argument (PRO) that is abstracted over by an operator to derive the individual interpretation. As an additional consequence, the only time nominalizations with -di can describe an event is when the verb does not take any individual arguments at all.

In §5, I explore why the English nominalizations in (3–4) do not exhibit the same semantic variability that nominalizations with -na and -di in Northern Paiute do. The POSS-ing gerund in fact has much the same structure as a nominalization with -na. Yet, it only has an event interpretation, I argue, because English lacks the system of operators and resumptive pronouns found in Northern Paiute. As for the other nominalization pattern, the -er suffix in English might at first glance resemble -di, but its syntax and semantics are actually quite different. The nominalizer itself closes off the verb’s event argument, so the nominalizations it creates never have an event interpretation.

2 Two deverbal nominalizers in Northern Paiute

Deverbal nominalizations share properties of both nouns and verbs. On the one hand, they have the external distribution of a nominal category. The nominalizations created by -na and -di in
Northern Paiute can, for instance, serve as the argument of a verb, as in (8a–b), or as the argument of a postposition, as in (9a–b).

(8) a. Su=nana patsa-na oo hapi.
   DEF.NOM=man kill.SG-NMLZ there lie.DUR
   ‘The thing the man killed is lying over there.’ (elicitation, EM, BP37-1-s, 18)

   b. Su=kutsu patsa-di mia-hu.
   DEF.NOM=cow kill.SG-NMLZ go-PUNC
   ‘The one who killed the cow left.’ (elicitation, EM, BP37-1-s, 16)

(9) a. Su=pa’mogo ka=nana ti-batsa-na-gguba kati.
   DEF.NOM=frog DEF.ACC=man NSP-kill-NMLZ-LOC sit.DUR
   ‘The frog is sitting on what the man killed.’ (elicitation, EM, BP32-7-s, 14)

   b. O-no’ona-ggwe nimmi ka=kutsu patsa-di-ggwe
   3SG-LOC-LOC 1PL.EXCL.NOM DEF.ACC=cow kill.SG-NMLZ-LOC
   mo’o.
   walk.DUR.PL
   ‘We walked around the one who killed the cow.’ (elicitation, MS, BP34-3-s, 38)

At the same time, deverbal nominalizations have the internal structure of a verbal category. Looking just at the nominalizations in (8a–b) and (9a–b), at the very least, we can say that they must contain a verb, patsa ‘kill (sg.).’

Within a phrase-structural theory of syntax, the mixed nature of nominalizations can be represented with structures that are, as Bresnan (1997:4) puts it, ‘partitioned into two categorially uniform subtrees such that one is embedded as a constituent of the other.’ The verb-like properties of a nominalization come from the verbal projection embedded inside the nominal projection (Kornfilt 1984, Borsley and Kornfilt 2000, Kornfilt and Whitman 2011). For Northern Paiute, I propose that -na and -di - are both realizations of a nominal functional head, which I will call Poss, when it takes a vP complement:5

---

4Northern Paiute, like other Numic languages, has a robust system of consonant mutation. The first consonant of any morpheme can take up to three different forms— lenis, fortis, or voiced fortis—depending on what the preceding morpheme is. For instance, the initial consonant in patsa ‘kill (sg.)’ is realized as a lenis stop (b) when it is preceded by the nonspecific patient prefix ti- in (9c), but as voiced fortis stop (bb) when it is preceded by the accusative second-person singular proclitic pronoun: i.e. i=bbatsa ‘kill you (sg.).’ See Babel et al. 2012 for details.

5If the -na and -di nominalizers are terminal nodes in the syntax, they must somehow appear as suffixes on the verb. I remain agnostic about how precisely this happens. In a strongly lexicalist framework, such as Lexical Functional Grammar (LFG) or Head-Driven Phrase Structure Grammar (HPSG), there are technically distinct ways of treating nominalization, which conceptually end up being quite similar (see, for instance, Bresnan 1997 and Malouf 2000a,b). It should be possible to translate the insights of the current proposal into a lexicalist framework.

I contend, however, that Poss can also take a vP complement in deverbal nominalizations in Northern Paiute. The Poss head that projects a specifier to which it assigns genitive case is realized overtly as the nominalizer -na when its complement is a vP. I assume that, if Poss is obligatorily present in the extended nominal projection, there must also be a defective version of the head, which does not project a specifier or assign case. This defective Poss would show up in DPs that are not possessive descriptions, and it is realized overtly as -di in deverbal nominalizations.

In the early literature on nominalization, nominalizers were taken to be members of a lexical category, not a functional category as I am proposing. The -ing suffix in POSS-ing gerunds, for instance, was analyzed as an N that takes a verb phrase complement (Horn 1975, Jackendoff 1977:222f.). This is problematic, though, for a couple of reasons. First, if nominalizers were themselves Ns, they would not have the same type of meaning as other members of this category. We are used to thinking of common nouns as describing a set of entities, but it is clear that the nominalizers do not have this kind of meaning. More importantly, we would expect to be able to substitute a regular noun in the same phrase-structural position as a nominalizer. But Ns do not take verb phrase complements.

The syntax that I am proposing for the two types of deverbal nominalization in Northern Paiute has three important components, which I will provide evidence for below:

- The -na and -di nominalizers embed a verbal constituent that is the size of a vP, and not one that is larger or smaller. In §2.1, I show that the nominalizations they create must contain at least a vP because: i) the direct object receives accusative case, ii) they can contain negation, and iii) they can contain adverbs that occur at the left edge of the verb phrase. They do not, however, contain a larger constituent because they cannot contain elements that are associated with higher verbal projections like TP and CP.

---

The Poss head is sometimes realized overtly in possessive descriptions. In Hungarian, for instance, the possessed noun in a possessive description bears an agreement suffix:

(i) a Péter kalap-ja
d the Peter hat-3SG
‘Peter’s hat’ (Szabolcsi 1987:171)

Szabolcsi (1987) argues that this agreement suffix is the overt realization of Poss, which agrees in person and number with the possessor in its specifier. (See Abney 1987:37–53 for discussion of similar languages.)
• The two nominalizers in Northern Paiute realize the Poss head. This predicts that nominalizations with -na and -di should be able to contain any of the categories located above Poss in the extended nominal projection. In §2.2, I show that both types of nominalization can occur under a determiner (D) and markers of number.

• The -na nominalizer projects a specifier to which it assigns genitive case—like the possessor in a possessive description—while -di does not. In §2.3, I show that nominalizations with -na always do contain a possessor. Then, in §2.4, I show that nominalizations with -di never do.

If this proposal is on the right track, it would mean that there are no constructions in English with a completely identical structure (though there might be some very similar ones, as I discuss in §5). Therefore, if we want to give translations of Northern Paiute sentences that are grammatical in English, it is necessary to use a variety of different syntactic structures. Often this involves a relative clause (8a) or a free relative (1b), both of which resemble deverbal nominalizations in Northern Paiute in one significant way. They enable a verbal category to have the distribution of a nominal category.

For this reason, a reviewer wonders why deverbal nominalizations in Northern Paiute cannot be given the same syntactic analysis as relative clauses or free relative in English. On a superficial level, this question is easy to answer. By definition, a relative clause is a clause that modifies a head noun (Andrews 2007:206), but in both types of nominalization in (1–2), there is no overt head noun. Nor can they be assimilated to free relatives, which are relative clauses marked by a relative pronoun that occurs without a head (van Riemsdijk 2006:340). There is no relative pronoun in either type of nominalization in (1–2).

Like relative clauses or free relatives, however, these nominalizations do describe an individual when they contain a gap. So the reviewer’s question can be restated in a different way: Does the same mechanism that derives the interpretation of relative clauses and free relatives in English also derive the individual interpretation of deverbal nominalizations in Northern Paiute? I will address precisely this question when we get to the semantics of deverbal nominalization in §3.3 and §4.1, respectively. For now, though, I turn to the evidence for the syntax of deverbal nominalization in Northern Paiute that I am proposing.

### 2.1 The verbal structure of deverbal nominalizations

Since at least Chomsky 1970, it has been known that deverbal nominalizations form a heterogeneous class whose members can be more or less verb-like (a fact also recognized in the typological literature; see Comrie 1976, Koptjevskaja-Tamm 1993:6f., Comrie and Thompson 2007:343–376). Some nominalizations, such as the POSS-ing gerund in (3a), resemble a clause to a much greater degree than others, such as the agent nominalization in (4a). If deverbal nominalizations contain a verbal projection embedded inside a nominal one, the ‘verbiness’ of a nominalization depends on how large the verbal projection it contains is (Kornfilt 1984, Borsley and Kornfilt 2000, Panagiotidis and Grohmann 2009, Kornfilt and Whitman 2011).

The two types of deverbal nominalization in Northern Paiute exhibit some properties of a clause, but not others. I will argue they embed only a vP, since they are able to contain elements associated just with this verbal projection, and not larger projections such as TP or CP.
2.1.1 The two nominalizers embed a vP

There are three pieces of evidence that nominalizations with -na and -di embed a verbal constituent that is at least as big as a vP.

First, direct objects of the verb are realized exactly as they would be in a clause, since v is present to assign them accusative case (Chomsky 2000:123f.). This means that ka=opo ‘the basket’ in (11a) and ka=toogga ‘the dog’ in (11b) can appear as direct arguments of the verb without the mediation of an adposition.

(11) a. Nii kai u=bbisabi ka=i=bia ka=opo
   1SG.NOM NEG 3SG.ACC=like DEF.ACC=1SG GEN=mother DEF.ACC=basket
   kia-kwi-na.
give-PROSP-NMLZ
   ‘I don’t like the one that my mother is going to give the basket to.’ (elicitation, EM, BP35-3-s, 9)

   b. Su=ka=toogga patsa-di wadzi-mia-hu.
   DEF.NOM=DEF.ACC=dog kill.SG-NMLZ hide-go-PUNC
   ‘The one who shot the dog ran away.’ (elicitation, MS, BP34-3-s, 45)

Moreover, the definite determiners of the direct objects in (11a–b) bear accusative case and are realized as ka=, rather than the nominative su=. Accusative case in Northern Paiute is also manifested morphologically on pronouns. The direct objects of both nominalizations in (12a–b) are the first-person singular accusative proclitic pronoun i=.

(12) a. Nii siddobbu’i ka=naatsi’i i=diikwi-na.
   1SG.NOM know.DUR DEF.ACC=boy 1SG.ACC=tell-NMLZ
   ‘I believe what the boy told me.’ (elicitation, EM, BP35-4-s, 15)

   b. Su=i=gwoti-hu-di mia-hu.
   DEF.3SG=1SG.ACC=shoot-PUNC-NMLZ go-PUNC
   ‘The one who shot me left.’ (elicitation, MS, BP35-4-s, 21)

Second, negation can occur inside both type of nominalization. In Northern Paiute, negation appears either in sentence-initial position, as in (13a), or following the subject at the left edge of the verb phrase, as in (13b) (Thornes 2003:328).

(13) a. Kai nimi wiupui-gga yaa.
   NEG person buckberry-have there
   ‘We have no buckberries this time.’ (dialogue, MS, BP23-1-t1, 3)

   b. Su=natizuabi kai togi i=ma-nimma.
   DEF.NOM=medicine NEG correct 1SG.ACC=IP hand-feel
   ‘The medicine doesn’t make me feel quite right.’ (elicitation, Thornes 2003:328)

Assuming that negation adjoins either to TP or to vP — the two positions where negation is attested cross-linguistically (Laka 1990:9–85) — when it adjoins to vP, it should be possible inside nominalizations. This is indeed the case:
I will return to the question of whether high negation is possible inside nominalizations shortly.

Finally, adverbs that occur at the left edge of the verb phrase can appear inside both types of nominalization. This includes *pidi* ‘just’ (15a–b) and the manner adverb *obida* ‘slowly’ (16a–b).

Assuming that *pidi* ‘just’ and manner adverbs like *obida* ‘slowly’ adjoin to vP, then the presence of these left-edge elements is expected if these nominalizations embed a vP.\(^7\)

2.1.2 The nominalizers do not embed a CP

But how do we know *-na* and *-di* do not embed a verbal constituent larger than vP? Northern Paiute has an inventory of clitics expressing various modal categories that occur in second position following the first major sentence constituent (Thornes 2003:336–341). The modal clitic =*sakwa*,

\(^7\)Aspectsual morphology is also possible inside deverbal nominalizations in Northern Paiute. In (i–ii), this is the so-called punctual suffix *-hu*, which encodes that the event described is ‘bounded, that is, whether or not either the initial or terminal endpoint is expressed or understood’ (Thornes 2003:407).
for instance, can occur after the subject (17a), a fronted direct object (17b), or a sentence-initial adverb (17c).

(17)  
   a. **li=sakwa** pida.  
       2SG.NOM=MOD start.fire  
       ‘You should start the fire.’ (elicitation, EM, BP33-5-s, 47)  
   b. **Himma=sakwa** tammi madabbui.  
       thing=MOD 1PL.INCL make  
       ‘We might make something.’ (elicitation, EM, BP34-2-s, 17)  
   c. **Mu’a=sakwa** tammi tiba’a hani-ga-ki.  
       tomorrow=MOD 1PL.INCL pinenut do-MOT-PROSP  
       ‘Tomorrow, we are going to go get pinenuts.’ (elicitation, EM, BP33-5-s, 51)

The modal clitic **=sakwa** is ungrammatical when it is the second element in a nominalization with -**na**, as shown in (19). It is likewise ungrammatical in a nominalization with -**di**, regardless whether it attaches to the determiner (19a) or to some other host, such as the direct object **tiba** ‘pinenut’ in (19b).

(18)  
   * Ni=i=dua=sakwa tika-na huna-ggwa wokwoti.  
       1SG.NOM DEF ACC=1SG GEN=son MOD eat-NMLZ outside-LOC throw  
       Intended: ‘I threw out what my son should have eaten.’ (elicitation, EM, BP37-1, 58:14)

(19)  
       DEF NOM=MOD PASS lock-NMLZ hide go-PUNC  
       Intended: ‘The one who should be locked up ran away.’ (elicitation, MS, BP34-4, 56:58)  
   b. * Su=tiba=sakwa hani-di oo siggwi kati.  
       DEF NOM=1PL INCL=MOD do-NMLZ there just sit  
       Intended: ‘The one who should be cleaning pinenuts is just sitting over there.’ (elicitation, EM, BP37-1, 49:14)

Assuming that modal clitics occupy C — like the highest auxiliary or main verb in verb-second Germanic languages (Koster 1975, among others) — the nominalizations created by -**na** and -**di** cannot embed a verbal constituent as large as CP.

2.1.3 The nominalizers do not embed a TP

There is also evidence that the nominalizers in Northern Paiute do not embed a TP. The T head itself is not obviously realized overtly in the language by auxiliaries or markers of tense and finiteness.\(^8\)

\(^8\)The so-called irrealis suffix -**dua** in Northern Paiute is unable to occur inside nominalizations with -**na** and -**di**:

(i)  
   * Nii ka=nana patsa-dua-na timi-hu.  
       1SG NOM DEF ACC=man kill SG=IRR-NMLZ buy-PUNC  
       Intended: ‘I bought the one that the man will kill.’ (elicitation, EM, BP43-2, 9:34)

(ii)  
    * I=kutsu kwati-dua-di kwana’a nobi-ka-’yu.  
       1SG GEN=cow shoot=IRR-NMLZ far house have NOM

10
But recall from (13a) above that negation in Northern Paiute can occur to the left of the subject in sentence-initial position. Assuming that it is adjoined to TP, nominalizations with \(-na\) do not embed a TP since they cannot contain high negation:

\[(20) \ * \ Su=\text{kai} \quad i=\text{dua} \quad \text{ti}ka-na \quad \text{pisa \ kamma.} \]
\[
\begin{array}{ll}
\text{DEF.NOM=NEG} & 1\text{SG. Gen=son \ eat-NMLZ \ good \ taste} \\
\end{array}
\]

Intended: ‘What my son didn’t eat tastes good.’ (elicitation, MS, BP43-2, 2:36)

Unfortunately, negation is not as useful for probing the structure of nominalizations with \(-di\) since they do not contain an overt subject — see §4.

More indirectly, though, we can see that neither type of nominalization in Northern Paiute embeds a TP, since they do not contain nominative case. In a regular clause, the subject receives nominative case, which in (21) is realized on the first-person singular nominative pronoun \(nii\) ‘I’.

\[(21) \ \text{Kai} \ nii \quad \text{oi}tu \quad \text{ti}ka-hu.\]
\[
\begin{array}{ll}
\text{NEG 1SG. NOM} & \text{there-LOC \ eat-PUNC} \\
\end{array}
\]

‘I didn’t eat any there.’ (narrative, EM, BP24-1-t1, 33)

In nominalizations with \(-na\), though, the highest argument of the embedded verb receives— not nominative case— but genitive case, like the possessor in a possessive description. Both the external argument of the \(-na\) nominalization in (22) and the possessor of the possessive description in (23) are realized as the genitive proclitic pronoun \(i=\) ‘my’.

\[(22) \ I=\text{saa-na} \quad ne-hu.\]
\[
\begin{array}{ll}
1\text{SG. GEN=cook-NMLZ \ burn-PUNC} \\
\end{array}
\]

‘What I was cooking burned.’ (elicitation, EM, BP32-9-s, 15)

\[(23) \ I=\text{babi’i} \quad oo \quad \text{habi-nimmi}.\]
\[
\begin{array}{ll}
1\text{SG. GEN=older.brother \ there \ lie-around} \\
\end{array}
\]

‘My older brother is lying over there.’ (elicitation, MS, BP32-4-s, 54)

Nominalizations with \(-di\), too, do not contain nominative case. It is ungrammatical for the highest argument of the verb to be realized overtly as the first singular nominative pronoun \(nii\) ‘I’ in (24).

\[(24) \ * \ Su=\text{mogo’ni} \quad nii \quad \text{na-dika-di} \quad \text{natiina-hu}.\]
\[
\begin{array}{ll}
\text{DEF.NOM=woman 1SG. NOM \ PASS-eat-NMLZ \ take.away-PUNC} \\
\end{array}
\]

Intended: ‘The woman took away what was being eaten by me.’ (elicitation, EM, BP43-2, 13:13)

Of course, as I will show later in §2.4, nominalizations with \(-di\) are not able to realize the highest argument of the verb overtly at all. For these reasons, I conclude that nominalizations in Northern Paiute only embed a vP.

A reviewer raises the possibility, however, that they embed a TP headed by a defective T head. Such an analysis has been proposed for so-called indicative nominalizations in Turkish, illustrated in (25a–b).

\begin{align*}
\text{Thornes} \ (2003:406) & \text{ writes that its function ‘...falls under the broad functional domain of irrealis. That is, the event is ‘hypothetical, possible, and uncertain’ (Givón 1984) [original emphasis].’ If the irrealis suffix realizes T, it would provide more direct evidence that nominalizations in Northern Paiute do not embed TP.}
\end{align*}
Kornfilt and Whitman (2011:1300ff.) propose that these nominalizations embed an entire TP because they express a tense contrast between future (25b) and nonfuture (25a). Crucially, however, Kornfilt and Whitman give three reasons that the head of this TP is DEFECTIVE. First, it is only able to convey a restricted range of tense interpretations: future and nonfuture, but not present or past. Second, the verb does not show any signs of $\varphi$-agreement. Third, the subject fails to receive nominative case and instead bears genitive case. In addition, Kornfilt and Whitman (2012:44) argue that the T head must be defective because adverbs, which do not surface preceding the subject, cannot adjoin to the TP embedded inside the nominalization.

If a defective T head does not assign nominative case, and if it can block negation from adjoining to TP just as it can an adverb, then it might be possible that the two types of nominalization in Northern Paiute embed a defective TP. But as far as I know, there is no evidence for this analysis over my proposal that they embed just a vP. Unlike Turkish, Northern Paiute does not have tense (Thornes 2003:396), and there is no tense contrast inside nominalizations. Fortunately, this analytical uncertainty does not affect the larger claim of this paper. Regardless of whether deverbal nominalizations in Northern Paiute embedded a vP or a defective TP, they would not contain nominative case. It is this property, and not the size of the verbal projection itself, that gives rise to the range of event and individual interpretations they can have.

2.2 The nominal structure of deverbal nominalizations

If the nominalizers -na and -di are realizations of the Poss head when it takes a vP complement, then any functional categories above Poss in the extended nominal projection should be able occur outside a nominalization.

Following much recent work, I assume that Poss is located below D(eterminer) and above N in the extended verbal projection:

\[ D > \text{Poss} > N \]

In this hierarchy, Poss is treated as the analogue of T(ense) in the verbal domain (Szabolcsi 1983, 1987, 1994, Cardinaletti 1998, Alexiadou et al. 2007:556–575). This is clearly inspired by the DP Hypothesis, proposed by Abney (1987:54–85) and Horrocks and Stavrou (1987) for English. But rather than the nominal correlate of T, D is treated as the nominal correlate of C. This parallelism between DP and CP was in some ways foreseen by Horrocks and Stavrou, who analyze Spec-DP in Greek as an $A'$-position that functions as an escape-hatch for movement, just like Spec-CP (see also Szabolcsi 1983, 1989 on Hungarian).

The position of Poss below D is needed to account for the location of possessors in a number of different languages, including Northern Paiute. For instance, in Italian, weak and clitic possessive
pronouns receive case in Spec-PossP, with the weak possessive pronouns surfacing there as well
(the clitics subsequently move even higher to D) (Cardinaletti 1998). In Hungarian, both pronomi-
nal and nonpronominal possessors can occur below the determiner in Spec-PossP (Szabolcsi 1983,
1987, 1994). In Northern Paiute, too, possessors can surface below D in Spec-PossP. Full DP pos-
sessors, as in (27a), and genitive strong pronouns, as in (27b), occur to the right of a determiner.

(27) a. Su=nana tua wadzi-mia.
   DEF.NOM=man son hide-go
   ‘The man’s son ran away.’ (elicitation, MS, BP32-3-s, 6)

b. Su=nana ka=nika puggu patsa-hu.
   DEF.NOM=man DEF.ACC=1SG.GEN horse kill.SG-PUNC
   ‘The man killed MY horse.’ (elicitation, EM, BP32-3-s, 23)

We have already seen that, as predicted, deverbal nominalizations in Northern Paiute can be
embedded under D. The nominalizations in (28) and (29a), repeated from (8a) and (9a) above,
both occur with overt determiners. It does not matter whether the possessor in nominalizations
with -na is a full DP, as in (29a), or a strong genitive pronoun, as in (29b).

(28) Su=kutsu patsa-di mia-hu.
   DEF.NOM=cow kill.SG-NMLZ go-PUNC
   ‘The one who killed the cow left.’ (elicitation, EM, BP37-1-s, 16)

   DEF.NOM=frog DEF.ACC=man NSP-kill.SG-NMLZ-LOC sit.DUR
   ‘The frog is sitting on what the man killed.’ (elicitation, EM, BP32-7-s, 14)

b. Su=naatsi’i ka=nika saa-na kai pisapi.
   DEF.NOM=boy DEF.ACC=1SG.GEN cook-NMLZ NEG like.DUR
   ‘The boy doesn’t like the thing I cooked.’ (elicitation, EM, BP37-2-s, 13)

There is another nominal category found in Northern Paiute that is not included in the hierar-
chy in (26): number. Some nouns can be marked for plural number with the suffix -mi -, e.g.
tua ‘son’ ∼ tuami ‘sons, children’ (Thornes 2003:100). For a small number of nouns — mostly ones
referring to humans— plural number can be marked through reduplication, e.g. moko’ni ‘woman’
∼ mommoko’ni ‘women’, or suppletion, e.g. siadi-mi ‘young woman’ ∼ sisia’a ‘young women’
(Thornes 2003:103). Neither of these instantiations of number tells us much about the hierarchical
position of the nominalizers, because they are realized on the noun itself.

There is, however, another more productive realization of plural number, the prenominal pro-
clitic mi=. Thornes (2003:131) analyzes the proclitic as a definite determiner, but I do not adopt
this analysis since mi= is not in complementary distribution with other definite determiners. As
shown in (30), it occurs immediately below the accusative definite determiner ka=.

(30) Su=hudziba ka=mi=na’ai-gguba-ggwe yodzi-huka.
   DEF.NOM=bird DEF.ACC=PL=boy.PL-LOC-LOC fly-INCH.DUR
   ‘The bird flew over the boys.’ (elicitation, MS, BP32-4-s, 51)

Instead, I assume that mi= is the realization of a Num(ber) head located immediately below D.
Nominalizations with -na and -di can show up embedded under the mi= plural marker:
(31) a.  
\[ \text{M}i=\text{i}=\text{yadua-na} \quad \text{yaa} \quad \text{aataa-di}. \]
\[ \text{PL}=1\text{SG GEN}=\text{talk-NMLZ there sit.PL-NMLZ} \]
‘People I was talking to are the ones sitting over there.’ (elicitation, EM, BP32-7-s, 27)

b.  
\[ \text{Su}=\text{nana} \quad \text{ka}=\text{mi}=\text{aataa-di} \quad \text{yadu’i}. \]
\[ \text{NOM}=\text{man DEF ACC}=\text{PL}=\text{sit.PL NMLZ talk to.DUR} \]
‘The man is talking to the ones who are sitting.’ (elicitation, EM, BP37-2-s, 7)

Just as we would expect if the nominalizers -\text{na} and -\text{di} realize Poss, the nominalizations they create can be embedded both under a determiner (D) and under the plural marker (Num).

2.3 An obligatory possessor in nominalizations with -\text{na}

While the two nominalizers are similar in many ways, I am proposing that they differ in one important way. While -\text{na} projects a specifier to which it assigns genitive case, just as the Poss head does in possessive descriptions, -\text{di} does not.

This makes two predictions. First, nominalizations with -\text{na} should always contain a DP in Spec-PossP. Indeed, when the embedded predicate is a zero-place predicate—such as the weather verb tieggwa ‘snow’—the expletive proclitic pronoun a= is obligatory:

(32) \[ \text{Ni}=*(\text{a}=)\text{ddiiggwa-winni-na} \quad \text{pinni}. \]
\[ 1\text{SG NOM} \quad 4\text{GEN}=\text{snow-STAT-NMLZ see DUR} \]
‘I see it snowing.’ (elicitation, EM, BP37-3, 1:14:26)

Second, since Spec-PossP is the position where possessors get genitive case, the DP that occupies this position in a nominalization with -\text{na} should have the same realization as a possessor. As I show below, this is indeed the case.

2.3.1 Genitive pronouns

When the possessor in a possessive description is a full DP, it bears no special morphology. In (27a) above, the possessor DP nana ‘the man’ is a bare noun. When the possessor is a pronoun, however, it receives a special realization. As shown in Table 1, there are two series of genitive pronouns in Northern Paiute, alongside the language’s nominative and accusative pronouns. The genitive strong pronouns are morphologically independent and are used when the possessor is focused, as in (33a), repeated from (27b) above. Otherwise, the genitive proclitic pronouns are used, which select the noun heading the possessive description as their host, as in (33b).

(33) a.  
\[ \text{Su}=\text{nana} \quad \text{ka}=\text{nika} \quad \text{puggu patsa-hu}. \]
\[ \text{DEF NOM}=\text{man DEF ACC}=1\text{SG GEN horse kill SG PUNC} \]
‘The man killed \textit{MY} horse.’ (elicitation, EM, BP32-3-s, 23)

b.  
\[ \text{Su}=\text{nana} \quad \text{i}=\text{buggu} \quad \text{patsa-hu}. \]
\[ \text{DEF NOM}=\text{man 1SG GEN}=\text{horse kill SG PUNC} \]
‘The man killed my horse.’ (elicitation, EM, BP32-3-s, 24)

\[ \text{The third-person singular pronouns are simply demonstrative pronouns: proximate i-, distal u-, and topical ma-.} \]
Table 1: Nominative, accusative, and genitive pronouns in Northern Paiute (Thornes 2003:155–169); parenthetical forms from the Mono Lake dialect

</tbody>
</table>

As an aside, observe that while the strong pronouns can cooccur with a determiner (33a), the proclitic pronouns are in complementary distribution with the determiner (33b). This is not an uncommon pattern crosslinguistically. To derive the same complementarity for genitive clitic pronouns in Italian, Cardinaletti (1998:17) proposes that they receive case in Spec-PossP but then undergo head movement to D. Assuming that head movement is substitution, if genitive proclitic pronouns in Northern Paiute raise to D, then they will be in complementary distribution with determiners. They will occupy D instead of an overt determiner. (Ultimately, though, the genitive proclitic pronouns must be realized with the noun heading the possessive description as their host.)

In nominalizations with -na the highest argument of the verb can be realized as a genitive pronoun—either a strong pronoun or a proclitic, as shown in (34a–b).

(34) a. Su=naatsi’i ka=nika saa-na kai pisapi.
DEF.NOM=boy DEF.ACC=1SG.GEN cook-NMLZ NEG like.DUR
‘The boy doesn’t like what I cooked.’ (elicitation, EM, BP37-2-s, 13)

b. I=saa-na ne-hu.
1SG.GEN=cook-NMLZ burn-PUNC
‘What I was cooking burned.’ (elicitation, EM, BP32-9-s, 15)

Note that no other case realization is possible for the highest argument of the verb. Specifically, it cannot receive nominative case—the canonical case realization for subjects—as shown in (35).

(35) *Nii saa-na ne-hu.
1SG.NOM cook-NMLZ burn-PUNC

Intended: ‘What I was cooking burned.’ (elicitation, EM, BP43-2, 11:14)

But how do we know that these arguments are not being assigned accusative case? As Table 1 shows, the proclitic pronouns are identical in both the genitive and accusative cases. And, in the Mono Lake dialect of Northern Paiute—on which I conduct fieldwork and from which most of my data comes—the distinction between the accusative and genitive pronouns has been neutralized.

---

10See van Riemsdijk 1998 for discussion of head movement as substitution vs. adjunction.
completely in both the proclitic and strong pronoun series. Unfortunately, in the resources available to me on other varieties of Northern Paiute (Liljeblad 1966, Snapp et al. 1982, Thornes 2003), there are no attested examples of a nominalization with -na where the highest argument is a strong pronoun. From the examples in (34–35), all we can conclude, then, is that there is no nominative case inside these nominalizations, and that it is possible that they contain a possessor.

Luckily, however, all varieties of Northern Paiute have a genitive reflexive anaphor ti=, which Thornes (2003:175) calls ‘[t]he most important distinction between the possessor proclitics and transitive object proclitics.’ In (36), the anaphor is the possessor of the noun toogga ‘dog’. Crucially, it is ungrammatical in direct object position, as shown in (37).

(36) Su=naatsi’i1 bino’o ka=ti=1 doogga haani; kuyaa o=dda-yaggwine’e-hu DEF.NOM=boy PTC DEF.ACC=REFL=dog scold far 3SG.ACC=IP.foot-kick-PUNC tabbu’a. look.like

‘The boy1 is scolding his1 dog, and then he kicks him to go away.’ (prompted narrative, MS, BP24-1-t3, 41)

(37) * Su=naatsi’i1 ti=1 bbuni. DEF.ACC=boy REFL=see

Intended: ‘The boy1 sees himself1.’ (elicitation, EM, BP37-2, 36:35)

This anaphor, which only functions as a possessor, can be the highest argument of a nominalization with -na:

(38) Oo uu ka=ti=1 ti-patsa-na usu idza1 pii owi manai there thusly DEF.ACC=REFL=NSP-kill.SG-NMLZ DEM.NOM coyote 3SG there do čaisi u-ma koggwi-u. then that-LOC take.away-PUNC

‘So it was of his1 kill, that Coyote1, he took it over then and took it away.’ (narrative, Thornes 2003:484)

In (38), the agent of the nominalized verb patsa ‘kill (sg.)’, projected as the genitive reflexive anaphor, corefers with the subject DP usu idza ‘that Coyote’.

2.3.2 Case on adjectives

The case realization of adjectives shows more indirectly that nominalizations with -na contain a possessor. When a possessor contains an adjective, it receives the case—either nominative or accusative—of the entire possessive description:

‘The short man’s son fell down.’ (elicitation, EM, BP32-3-s, 18)

‘I like the short man’s dog.’ (elicitation, EM, BP37-2-s, 18)
The adjective *miitsi* ‘short’ gets the nominative case suffix `-yu` in a possessive description that is the subject (39a), and the accusative case suffix `-ggu` in a possessive description that is the direct object (39b). When the highest argument in a nominalization with `-na` contains an adjective, it exhibits the same pattern of case marking:

(40) a. \[[DP Su=][DP miitsi-'yu nana] saa-na] pisa kamma.\]
    DEF.NOM=short-NOM man cook-NMLZ good taste
    ‘What the short man cooked tastes good.’ (elicitation, EM, BP37-2-s, 19)

b. \[[DP ka=][DP wahaggu momoko’ni] saa-na] pisapi.\]
    1SG.NOM DEF.ACC=two-ACC women cook-NMLZ like.DUR
    ‘I like what the two women cooked.’ (elicitation, EM, BP32-8-s, 9)

An adjective (or numeral) is realized with nominative case in (40a) when it modifies the highest argument of a nominalization in subject position, and it is realized with accusative case in (40b) when it modifies the highest argument of a nominalization in direct object position.

As a reviewer points out, this pattern of case concord is somewhat unusual, since the adjective does not agree with the closest case-bearing head. Assuming that DPs get case by valuing a case feature on D, when an adjective is contained within a possessor, the closest D that can value the adjective’s own case feature should be the one that heads the possessor DP. But as we have seen, an adjective contained within the possessor does not agree in genitive case:

I suspect that this pattern might arise because adjectives are formally deficient in Northern Paiute. Say that the case feature on an adjective can only have certain values. Specifically, it can be valued as either nominative or accusative, but not genitive. When an adjective occurs inside a possessor, then, the closest head bearing a case feature that it can agree with will not be the D heading the possessor DP. Rather, it will be the D heading the entire possessive description.\(^\text{11}\)

\(^{11}\)Deal (2013:409–413) argues for Nez Perce that genitive case is assigned at PF, to DPs that lack nominative or accusative case for some reason. Assuming that Northern Paiute works the same way, a reviewer observes that even
2.3.3 Possessor extraction and pied-piping

Possessors in Northern Paiute do not obey the Left Branch Condition. They can be extracted through obligatory wh-movement to sentence-initial position, as in (42a). Wh-possessors can also optionally pied-pipe the rest of the possessive description along with them, as shown in (42b).

(42) a. Haga\_1 \_i\_ [DP t\_1 kaadzi] pisapi?
   who.GEN 2SG.NOM car like.DUR
   ‘Whose car do you like?’ (elicitation, EM, BP33-5-s, 19)

b. [DP Haga kaadzi] \_i\_ t\_1 pisapi?
   who.GEN car 2SG.NOM like.DUR
   ‘Whose car do you like?’ (elicitation, EM, BP33-5-s, 18)

The highest argument in nominalizations with -\textit{na} exhibits the same pattern. When it is a wh-phrase, it can be extracted by itself (43a) or the rest of the nominalization can raise with it to sentence-initial position (43b).

(43) a. Haga\_1 su=nana [DP t\_1 ti-batsa-na] tidiha-huka?
   who.GEN DEF.NOM=man NSP-kill-NMLZ steal-INCH.DUR
   ‘Whose kill did the man steal?’ (elicitation, EM, BP33-5-s, 15)

b. [DP Haga ti-batsa-na] \_i\_ su=nana t\_1 wadzi-hani-huka?
   who.GEN NSP-kill-NMLZ DEF.NOM=man hide-do-INCH.DUR
   ‘Whose kill did the man take away?’ (elicitation, EM, BP33-5-s, 13)

This optional pied-piping of nominalizations is expected if the wh-phrase in (43a–b) is a possessor.

2.4 No possessor in nominalizations with -\textit{di}

If -\textit{di} realizes the Poss head when it does not project a specifier, then the nominalizations it creates should NEVER contain a possessor. Indeed, adding a possessor to the nominalization in (44a) is ungrammatical, regardless of whether it is a genitive pronoun (44b), a nominative pronoun (44c) or a full DP (44d).

(44) a. Su=mogo’ni ka=na-dika-di natiina-hu.
   DEF.NOM=woman DEF.ACC=PASS-eat-NMLZ take.away-PUNC
   ‘The woman took away what was being eaten.’ (elicitation, MS, BP37-2-s, 29)

b. *Su=mogo’ni i=na-dika-di natiina-hu.
   DEF.NOM=woman 1SG.GEN=PASS-eat-NMLZ take.away-PUNC
   Intended: ‘The woman took away what was being eaten by me.’ (elicitation, EM, BP37-2, 57:04)

if the entire possessor does receive genitive case later on, at the point in the derivation when nominative or accusative case is assigned, there would be no intervening case feature for adjectives. Consequently, they would be assigned the same case as the entire possessive description.
   DEF.NOM=woman 1SG.NOM PASS-eat-NMLZ take.away-PUNC
   Intended: ‘The woman took away what was being eaten by me.’ (elicitation, EM, BP43-2, 13:13)

   DEF.NOM=woman DEF.ACC=man PASS-eat-NMLZ take.away-PUNC
   Intended: ‘The woman took away what was being eaten by the man.’ (elicitation, EM, BP37-2, 1:01:17)

It does not make a difference if the nominalization describes an event as opposed to an individual. The nominalization in (45a) becomes ungrammatical when a genitive proclitic pronoun is added, as shown in (45b).

(45) a. Nii ka=tiiggwa-di punni.
   1SG.NOM DEF.ACC=snow-NMLZ see.DUR
   ‘I see it snowing.’ (elicitation, EM, BP37-2-s, 32)

b. * Nii a=ddiiggwa-di punni.
   1SG.NOM 4.GEN=snow-NMLZ see.DUR
   Intended: ‘I see it snowing.’ (elicitation, EM, BP37-2, 1:04:03)

Unlike the parallel nominalization with -na in (32), the nominalization with -di in (45b) is ungrammatical because it contains a possessor.

I have argued that the deverbal nominalizers -na and -di realize Poss—the nominal functional head that canonically assigns case to possessors—when it takes a vP complement. This accounts for the noun-like external distribution of the nominalizations they create, as well as their verb-like internal structure. In addition, I argued that while -na projects a specifier to which it assigns genitive case, -di is defective and does not project a specifier position at all. With a syntax in hand for the two types of deverbal nominalization in Northern Paiute, I now go on to show how they are able to describe both events and individuals.

3 The interpretation of nominalizations with -na

Some basic examples of nominalizations with -na are presented again below. They can describe an event (46a–c) or an individual participating in an event (47a–b).

(46) a. Su=nana ka=toogga patsa-na idzi’i.
   DEF.NOM=man DEF.ACC=dog kill.SG-NMLZ yesterday
   ‘The man’s killing the dog happened yesterday.’ (elicitation, MS, BP32-4-s, 29)

   1SG.NOM DEF.ACC=Grace song-make-NMLZ like.DUR
   ‘I like Grace’s singing.’ (elicitation, EM, BP32-9-s, 7)

c. Nii ka=mogo’ni tiba’a saa-na ikwi.
   1SG.NOM DEF.ACC=woman pinenut cook-NMLZ smell
   ‘I smell the woman cooking pinenuts.’ (elicitation, EM, BP32-7-s, 35)
The nominalizations in (47a–b) clearly refer to individuals since the matrix verbs express predicates that can only hold of individuals. The ones in (46a–c), however, deserve a bit more scrutiny.

There are two arguments that nominalizations created by -na do, in fact, describe events. First, they can serve as the argument to a predicate of events. In (46a), for instance, the nominalization in subject position is being predicated of the temporal adverb idzi’i ‘yesterday’. Accordingly, the sentence entails that an event of the man killing the dog occurred during a certain time interval. (Note that Northern Paiute is a null copula language, so the adverb can function as a predicate without an overt verb.) In addition, in (46c), the nominalization is the direct object of the perception verb ikwi ‘smell’, so that the sentence entails that the speaker perceives an event of the woman cooking pinenuts through smell. This is truth-conditionally distinct from simply perceiving one of the individuals participating in the event. If you perceive an event of the woman cooking pinenuts through smell, you do not necessarily perceive either the woman or the pinenuts.

A reviewer questions whether the nominalization in (46c) really is the direct object of the perception verb. Why can the accusative determiner ka= in (46c) not be parsed with the possessor mogo’ni ‘woman’? Recall from §2.3.1 that genitive clitic pronouns are in complementary distribution with overt determiners. When the possessor in (46c) is replaced with a genitive clitic
pronoun, the accusative determiner cannot be overt, as shown by the contrast in (48a–b).

(48) a. Ni\text{\textunderscore}i - i = hubia-du-na naka.
\hspace{1cm} 1SG.NOM 2SG.GEN= song-make-NMLZ hear
\hspace{1cm} ‘I hear you singing.’ (elicitation, EM, BP48-1-s7)
b. * Ni\text{\textunderscore}i ka\text{\textunderscore}i = hubia-du-na naka.
\hspace{1cm} 1SG.NOM DEF.ACC\text{\textunderscore}i= song-make-NMLZ hear
\hspace{1cm} Intended: ‘I hear you singing.’ (elicitation, EM, BP48-1, 13:46)
c. Ni\text{\textunderscore}i ka\text{\textunderscore}i= bia hubia-du-na naka.
\hspace{1cm} 1SG.NOM DEF.ACC\text{\textunderscore}i= mother song-make-NMLZ hear
\hspace{1cm} ‘I hear my mother singing.’ (elicitation, MS, BP48-1-s8)

Of course, when the subject is a full DP, the accusative determiner can be overt, as shown by (48c) or by the original example in (46c). This distribution follows straightforwardly if the accusative determiner forms a constituent with the entire nominalization, which is serving as the direct object of the perception verb.

The second argument that the nominalizations in (46a–c) do indeed describe events comes from the fact that the nominalizer -na can apply to zero-place predicates, such as the weather verbs pauma ‘rain’ and ti\text{\textunderscore}iggwa ‘snow’. Assuming that these predicates do not take any individual-type arguments, the nominalizations in (49a–b) must describe events.

(49) a. Ni\text{\textunderscore}i a\text{\textunderscore}bbau ma\text{\textunderscore}winni\text{\textunderscore}na naka.
\hspace{1cm} 1SG.NOM 4.GEN= rain-STAT-NMLZ hear
\hspace{1cm} ‘I hear it raining.’ (elicitation, MS, BP37-1-s, 6)
b. Su\text{\textunderscore}nana a\text{\textunderscore}ddi\text{\textunderscore}iggwa\text{\textunderscore}winni\text{\textunderscore}na\text{\textunderscore}ggwe nika.
\hspace{1cm} DEF.NOM= man 4.GEN= snow-STAT-NMLZ-LOC dance
\hspace{1cm} ‘The man is dancing during its snowing.’ (elicitation, EM, BP43-2, 15:54)

In (49a), the speaker perceives an event of raining through hearing, and in (49b), the man is dancing during an event of snowing. (The postposition -ggwe can express a relation of temporal overlap in addition to its locatival meaning.)

Whether they describe an event or an individual, nominalizations with -na have the same basic structure, shown schematically in (50). The nominalizer overtly realizes Poss when it takes a vP complement, and it projects a specifier position to which it assigns genitive case.

Third, if the subject in (46c) were the raised object of the verb ikwi ‘smell’, it would occur in the wrong linear position. Derived objects, such as the beneficiary added in an applicative construction, as in (iii), occur immediately before the verb, to the right of the underlying direct object (Thornes 2003:307).

(iii) Ni\text{\textunderscore}i ka\text{\textunderscore}i= huba i\text{\textunderscore}bia saa- ggi\text{\textunderscore}ti.
\hspace{1cm} 1SG.NOM DEF.NOM= soup 1SG.GEN= mother cook-APPL-TNS
\hspace{1cm} ‘I cooked soup for my mother.’ (elicitation, EM, BP34-2-s, 35)

In contrast, the hypothetical raised object in (i) would occur farther to the left, preceding the nominalization inside which it originated.
Before getting to the interpretation of nominalizations with -na, I start by showing in §3.1 that the possessor is always interpreted as an argument of the nominalized verb. Consequently, I propose that it originates inside the embedded vP and raises to Spec-PossP to get case. Then, moving on to the event interpretation in §3.2, I demonstrate that it comes for free, in a manner of speaking, when all of the embedded verb’s individual-type arguments are saturated. The individual interpretation arises as a special case, in contrast, when one of the verb’s arguments is saturated by a resumptive pronoun. I argue in §3.3 that, because Northern Paiute has operators that can abstract over the variables contributed by these pronouns, nominalizations created by -na describe an individual. Moreover, the antilocality property of resumptive pronouns accounts for why nominalizations with -na only describe individuals that are NOT the highest argument of the verb.

3.1 The possessor in deverbal nominalizations

The possessor bears the theta role of the highest argument of the verb. For instance, in (51), repeated from (46a) above, the possessor is the agent of the transitive verb saa ‘cook’.

\[(51) \text{Ni} \text{i} \text{ka=mogo’ni tiba’a saa-na ikwi.} \]
\[1\text{SG.NOM DEF.ACC=woman pinenut cook-NMLZ smell} \]
\[\text{‘I smell the woman cooking pinenuts.’ (elicitation, EM, BP32-7-s, 35)} \]

This interpretation is obligatory. In the context in (52), where the possessor i=naa’a ‘my father’ does not satisfy the agent entailments of the transitive verb patsa ‘kill (sg.)’, the sentence is infelicitous.

\[(52) \text{[My father was driving along when he sees a dead deer along the side of the road. He picks it up and brings it home.]} \]
\[\# \text{Mu’a tammi i=naa’a ti-batsa-na tika-kwi.} \]
\[\text{tomorrow 1PL.INCL 1SG.GEN=father NSP-kill-NMLZ eat-PROSP} \]
\[\text{‘Tomorrow we are going to eat what my father killed.’ (elicitation, EM, BP33-5, 44:59)} \]
\[\text{[EM: “That wasn’t true...He just telling lie, I guess. Just fooling them or something.”]} \]

The native speaker reported that the sentence is not true in the context given, because the speaker’s father is not the agent of the killing event. The deer is already dead when he finds it.

This property of nominalizations with -na follows straightforwardly if the possessor originates inside the embedded vP as an argument of the verb. The event nominalization in (51), for instance, has the structure in (53).

\[(50) \text{DP} \]
\[\text{D PossP} \]
\[\text{DP Poss’} \]
\[\text{vP Poss} \]
\[\text{...V...} \]
\[\text{-na} \]
Because *saa* ‘cook’ is transitive, v assigns accusative case to the direct object. The possessor DP *mogo’ni* ‘woman’ originates in Spec-vP, where it receives the agent theta role from the embedded verb *saa* ‘cook’. Since the nominalization does not contain T, and hence does not contain nominative case, the possessor can only get case by raising to Spec-PossP, where it is assigned genitive case.

This movement takes place overtly. The possessor in nominalizations with *-na* occurs to the left of adverbs that themselves occur at the left edge of the verb phrase:

(54)  
I=bia 
1SG.GEN=mother

*obida* ka=tíba’a sa’a.
1SG.GEN=mother *slowly DEF.ACC=pinenut cook.DUR*

‘My mother cooked the pinenuts slowly.’ (elicitation, EM, BP37-1-s, 20)

(55)  
I=bia 
1SG.GEN=mother

*obida* saa-na niń tika.
1SG.GEN=mother *slowly cook-NMLZ 1SG.NOM eat*

‘I ate what my mother cooked slowly.’ (elicitation, EM, BP37-1-s, 21)

In a basic SOV sentence like (54), the manner adverb *obida* ‘slowly’ occurs to the left of the direct object, at the left edge of the verb phrase. Assuming that manner adverbs adjoin to vP (Pollock 1989:366), the agent of the nominalization in (55) must have raised to Spec-PossP, since it appears to the left of *obida* ‘slowly’.

While the possessor is the agent in (51), under my account it need only be the HIGHEST argument of the verb. Indeed, when *-na* embeds an unaccusative or passive verb, the possessor bears a different theta role:

(56)  
*Su=toogga* 
DEF.NOM=dog

*akwisiyai-na* i=masia-hu.
1SG.ACC=scare-PUNC

‘The dog’s sneezing scared me.’ (elicitation, EM, BP33-3-s, 7)

(57)  
I=bia 
1SG.GEN=mother

*na-bida-ggi-na* nai-hu.
1SG.GEN=mother PASS-make.fire-APPL-NMLZ burns-PUNC

‘The fire that was built for my mother burned.’ (lit. What was fire-built for my mother burned.) (elicitation, EM, BP34-2-s, 43)
In (56), the possessor is the patient of *akwiśiyai* ‘sneeze’; in (57), it is the beneficiary *i=bīa* ‘my mother’, which is added by the applicative suffix before the predicate is passivized. Since these predicates lack an external argument, accusative case is not assigned, in accordance with Burzio’s Generalization. It is consequently an internal argument of the verb that lacks case and raises to Spec-PossP.

We might wonder, if the highest argument in a deverbal nominalization occupies Spec-PossP, whether it also has the semantics of a possessor. The possession relation in possessive description is, of course, notoriously variable. The possessor can stand in a variety of superficially different semantic relations to the possessee, determined in part by the noun that heads the possessive description. In (58a), for instance, the possessor *Kaabidzi* ‘Kaabidzi’ is interpreted as the spouse of the possessee, because the noun *nodikwa* ‘wife’ is inherently relational.

(58) a. kaabidzi nodikwa
   Kaabidzi wife
   ‘Kaabidzi’s wife’ (Thornes 2003:145)

b. [My younger brother and sister each have a frog.]
   I=gwana’a pa’mogo isikwidda-dī.
   1SG. GEN=younger.brother frog be.brown-NMLZ
   ‘My younger brother’s frog is brown.’ (elicitation, EM, BP34-5, 17:40)

c. [I go out hunting with my father and my younger brother. Only I have a gun. My father and younger brother each see a different deer at the same time.]
   Niī i=naa’a tihidda patsa-hu.
   1SG. NOM 1SG. GEN=father deer kill.SG-PUNC
   ‘I shot my father’s deer.’ (elicitation, MS, BP37-3, 1:13:46)

For nouns that are inherently nonrelational, the possession relation is context dependent and varies with the context of utterance. In (58b), an ownership relation holds between the speaker’s younger brother and the frog, and in (58c), a seeing relation holds between the speaker’s father and the deer.

To account for this variability, I assume, following Szabolcsi (1994), that the Poss head itself does not contribute the content of the possession relation. When the possessee is an inherently relational noun, the possessor in Spec-PossP stands in whatever relation is described by the noun itself (or is added by a nominal functional head on par with v in the verbal domain; Valois 1991:15ff., Sportiche 1998:216–230, Carstens 2000, Radford 2000, Bowers 2011). For deverbal nominalizations in Northern Paiute — which are parallel to inherently relational nouns, as the semantic relationship between the possessor and the verb is constant and does not vary — Poss would consequently not add any additional meaning. The possessor receives the theta role of the highest argument of the verb because it starts out inside the vP and then raises to Spec-PossP where it receives case.

\[\text{Szabolcsi still takes the Poss head to be the formal theta-assigner for the purposes of the Theta Criterion. The content of the theta role assigned to the possessor in Spec-PossP must then somehow be transmitted from the possessee when it is an inherently relational noun. I do not have too much to say here about formal theta role assignment — if it exists at all — except to observe, as Szabolcsi herself does (p. 192f.), that this would require abandoning the assumption that theta roles are always assigned to DPs in their base-merged position (at D-structure), since the possessor originates low and raises to Spec-PossP.}\]
If the Poss head in nominalizations with -na obligatorily projects a specifier but does not itself impose any semantic requirements on it, then it should be possible for that position to be filled by an expletive pronoun. In a normal clause, zero-place predicates, such as the weather verb tīggwa ‘snow’ in (59), do not require an overt subject. But when the same verb is nominalized with -na, as in (60), the expletive a= is obligatory.

(59) Tīggwa-winni.
    snow-STAT
    ‘It’s snowing.’ (elicitation, MS, BP32-4-s, 13)

(60) Nī  *(a=)ddiiggwa-winni-na  punni.
    1SG.NOM  4.GEN=snow-STAT-NMLZ  see.DUR
    ‘I see it snowing.’ (elicitation, EM, BP37-3, 1:14:26)

In its contentful use, the fourth-person genitive proclitic pronoun a= identifies an indefinite antecedent. In its expletive use, it fills Spec-PossP and checks genitive case when there is no DP that can raise there.

Before moving on, let me raise the issue of where the context-dependent possession relation comes from with nonrelational nouns. To some degree, we do not have worry about this here, since the possession relation in deverbal nominalizations with -na is determined entirely by the embedded verb. But as I understand Szabolcsi (p. 197), when the possessee is a nonrelational noun, the context-dependent possession relation is introduced by a process of derivational morphology that takes an inherently nonrelational noun and turns it into a relational noun. A similar idea is found in the semantics literature, where the context-dependent possession relation is introduced through a type-shifting operation that applies to nonrelational nouns (Pustejovsky 1993, Jensen and Vikner 1994, Partee and Borschev 1998). This permits a uniform syntax and semantics for possessors, both when the possessee is inherently relational and nonrelational, as well as in deverbal nominalizations.14

3.2 The event interpretation

Since -na projects a specifier position to which it assigns genitive case, all of the embedded verb’s individual-type arguments can be saturated, even though there is no nominative case inside the nominalization. The event interpretation of -na follows straightforwardly from this syntax, once some additional assumptions are in place about how verb phrases are interpreted.

Since Davidson 1967, it is frequently assumed that predicates take an event argument in addition to their regular complement of individual-type arguments. It is this event argument that Kratzer (1996) argues holds the verb phrase together semantically. In her neo-Davidsonian event semantics, both V and v denote relations between individuals and events. V relates the internal arguments to an event, and v relates the external argument to an event. These predicates of events are combined by a rule of Event Identification, which Kratzer defines (p. 122) as follows:15

---

14 As a reviewer points out, however, such an approach might not be able to derive the contrast between relational and nonrelational nouns when the possessor occurs after the noun in the Norman of-genitive: i.e. a child of John vs. *a firetruck of John (Partee 1997:465, Barker 1995:9). See Partee and Borschev 2002 and Barker 2011 for discussion of precisely this question.

15 I assume a type-theoretic, compositional, extensional semantics that has, in addition to other rules defined in the
(61) Event Identification
\[ \lambda x \lambda e (\alpha(x)(e) \land \beta(e)) : \langle e, \langle s, t \rangle \rangle \]

Event Identification takes one function of type \( \langle e, \langle s, t \rangle \rangle \) (a function from individuals to functions from events to truth values) and another function of type \( \langle s, t \rangle \) (a function from events to truth values) and returns a function of type \( \langle e, \langle s, t \rangle \rangle \). In other words, Event Identification combines two predicates of events by abstracting over both of their event arguments.

The semantic composition of the event nominalization in (51) can then proceed as follows:

(62) \[ \tau'(\text{cook}(\text{pinenuts})(e') \land \text{agent}(\text{the-woman})(e')) : s \]

\[ \lambda y \lambda e (\text{cook}(\text{pinenuts})(e) \land \text{agent}(\text{the-woman})(e)) : \langle s, t \rangle \]

Event Identification combines the predicates of events expressed by the VP and \( v \) to produce a predicate of events whose sole individual argument is the external argument (\( \overline{1} \)). Assuming that traces are interpreted as variables, this argument is saturated by the trace left behind by the DP \( \textit{mogo'ni} \) ‘the woman’ when it raises to Spec-PossP.

This leaves only the predicate’s event argument unsaturated (\( \overline{2} \)). In clauses, the event variable is existentially bound, so that the sentence has a truth value as its extension. I assume that this operation applies at the vP level through an optional operation of Existential Closure. In a nominalization where all individual-type arguments have been saturated, Existential Closure cannot apply. Existentially binding the event argument would produce a type mismatch, since the embedded vP
must still combine with the remainder of the noun phrase.\textsuperscript{16}

In particular, the determiner calls for a set of entities as its argument (Barwise and Cooper 1981). I assume that the nominalizer -\textit{na} itself denotes the identity function, because it does not contribute anything to the semantics of nominalization (\textsuperscript{3}). It takes a set of entities and returns a set of entities. Following $\lambda$-abstraction over the trace in Spec-vP (\textsuperscript{4}), the DP in Spec-PossP satisfies this argument to produce the set of events of the woman cooking pinenuts (\textsuperscript{5}). The definite determiner $ka=$ takes this set and returns its unique member (\textsuperscript{6}). The entire DP refers to the event of the woman cooking pinenuts (\textsuperscript{7}).\textsuperscript{17}

The event interpretation arises, then, because the determiner requires a set of entities to apply to. By making an additional case available inside nominalizations, -\textit{na} permits all of the embedded predicate’s individual arguments to project. Once the individual arguments have all been saturated, only the event argument is left open. Consequently, nominalizations with -\textit{na} describe an event. This interpretation comes for free, in some sense, because of the syntax of -\textit{na} itself. It embeds a vP, and it projects a specifier to which it assigns genitive case.

### 3.3 The individual interpretation

Leaving open the embedded predicate’s event argument is not the only way to fashion a set of entities. There can also be a gap in the position of an individual argument, as in (63), repeated from (47) above. When this happens, the nominalization describes an individual.

(63) a. \textit{Nii ka=i=naa’a saa-na tika.}  
\textsuperscript{1SG.NOM DEF.ACC=1SG.GEN=father cook-NMLZ eat}  
‘I ate \textit{the thing that my father cooked}.’ (elicitation, EM, BP37-2-s, 35)

b. \textit{Ka=i=naa’a pi-kuba kati-na ni \textit{tii} timi-dua.}  
\textsuperscript{DEF.ACC=1SG.GEN=father PRO-LOC sit-NMLZ 1SG.NOM buy-IRR}  
‘I will buy the one my father is sitting on.’ (elicitation, MS, BP34-5-s, 6)

In (63a), there is no overt DP projected as the internal argument of the verb \textit{saa ‘cook’}; and, in (63b), the argument of the postposition -\textit{kuba} is projected as the pronounal element \textit{pi}.

The nominalizations in (63) are reminiscent of relative clauses, which contain an individual argument gap and denote a set of individuals. This kind of configuration is usually taken to arise from an A’-dependency holding between an operator and an expression in argument position that semantically contributes a variable. In relative clauses in English, this variable, which is bound by the operator, is contributed by the A’-trace of the operator itself (Chomsky 1977:87). I will assume that the individual interpretation for nominalizations with -\textit{na} also arises from an A’-dependency of some kind. But it does not arise through movement, as in English relative clauses. Rather, I will present evidence that the A’-dependency arises when a $\lambda$-operator binds a resumptive pronoun, which contributes the variable.

\textsuperscript{16}Alternately, following Hacquard (2010), it might be possible for the event argument to be saturated at the vP level by an event variable. For the nominalization to compose successfully, this event variable would still not be existentially bound. Instead, it would be abstracted over to create a set of events that is able to combine with the determiner. While this would make the composition of event nominalizations more parallel to the composition of individual nominalizations — see §3.3 below — I can think of no empirical reason to favor it.

\textsuperscript{17}I have assumed a Davidsonian conception of events. But there might be advantages to thinking of events as minimal situations. See Portner 1992:88–145 and Zucchi 1993 for discussion specifically related to nominalization.
Under my proposal, the nominalization in (63a) would have the following structure, in which a null pronoun occupies the direct object position:

(64) DP
    /\         \
   D | \     PossP
      \ |   \2
     ka= λ   Poss'
      \     /DP
        \ i=naa vP
        \    /Poss
          \  /-na
         \ / v'
        VP  v

The resumptive pronoun enters into an $A'$-dependency with a $\lambda$-operator, which is adjoined to the complement of D for semantic reasons. The determiner requires a set of entities as its argument, which its complement can provide only if there is a $\lambda$-operator to bind the variable contributed by the pronoun in its scope. The nominalization in (63b) with a gap in an oblique position would have a parallel structure, except that the pronoun is realized overtly as $pi$.

The composition of the individual-denoting nominalization in (63a) starts off much like the event-denoting nominalization in §3.2. But one of the predicate’s individual-type arguments is saturated by the free variable introduced by the pronoun, as shown in the following parsetree:
Once the predicate’s individual-type arguments are saturated, the vP denotes a predicate of events (1). In this nominalization, however, the event argument is existentially bound by Existential Closure (2). This does not trigger a type mismatch since there is a pronoun inside vP. The determiner requires a set of entities as its argument (3). This can give rise to a universal-like interpretation:

A reviewer wonders how these null resumptive pronouns are licensed. In fact, nothing special needs to be said, since resumptive pronouns are formally identical to nonresumptive pronouns.

---

18Note that the determiner can be an overt demonstrative or definite determiner, as in (63a), or it can be phonologically null. When the determiner is null, it picks out the unique (nonatomic) individual, much like a free relative (Jacobson 1995, Caponigro 2003). This can give rise to a universal-like interpretation:

(i) ‘Having got there, we picked a lot [of chokecherries] at that place. Everyone, we picked along with our mother. Later on we, having picked a lot, we came back again.’

Mi=ti-dzapoka-na nimimi ni=hi-kwai-ku nimimi, oo
1PL.EXCL.GEN=NSP-pick-NMLZ 1PL.EXCL.NOM 1PL.EXCL.GEN=what-LOC-LOC 1PL.EXCL.NOM so
tia’ nimimi tsaa-čakwi-na... thusly 1PL.EXCL.NOM IP.fist-do-NMLZ
‘What we picked we carried in our whatchamacallit (bag) like so...’ (narrative, Thornes 2003:523)

In (i), the speaker is talking about ALL of the chokecherries that were picked, not just a (unique) individual chokecherry. In particular, because the null pronouns in (66a–b) are referential, the reviewer asks whether they must be both licensed and identified, as in Rizzi’s (1986) theory of pro. That is, do the null pronouns have to check all the φ-features (both person and number) of their governing category? Since Northern Paiute has neither subject nor object agreement, there are no morphologically realized φ-features on the verb for the null pronouns to check, just as in
McCloskey (2006:96) states that he ‘know[s] of no report of a language that uses a morphologically or lexically distinct series of pronouns in the resumptive function.’ At least for null pronouns, this generalization holds in Northern Paiute. When an argument is previously given in the discourse, it can be realized as a null pronoun in direct object position (66a), as well as in subject position (66b).

(66) a. Pa’mogo₁=bino’o ka=hanno=sabbi mia-hu. Kai ni⁺ pro₁ punni.
   frog=PTC DEF.ACC=where=PTC go-PUNC NEG 1SG.NOM see.DUR
   ‘And the frog₁ went, I don’t know where. I don’t see it₁.’ (prompted narrative, MS, BP24-1-t3, 58–59)

b. Obina-ggwe yaisi mi=nigga-di₁=bino’o ka=paaskiti pibo’a. Yaisi
   after-LOC PTC PL=dance-NMLZ=PTC DEF.ACC=basket throw.DUR PTC
   oo’ni yaisi na-ma-maggwi-hu-si, yaisi pro₁ tika...
   later PTC PASS-PLUR-finish-PUNC-SEQ PTC eat
   ‘Afterwards the dancers₁ throw the basket. Then, after it is finished, they₁ eat...’
   (narrative, MS, BP13-4-t2, 12–13)

All null pronouns in Northern Paiute can thus be licensed formally in the same way. Outside of an individual-denoting nominalization, they refer to an individual. But in an individual-denoting nominalization, a null pronoun in the scope of a $\lambda$-operator can be bound and the free variable it contributes abstracted over.  

Mandarin Chinese. Perhaps, as Rizzi suggests (p. 545f.), the identification condition on null pronouns is vacuously satisfied in these languages without overt agreement.

The resumptive pronoun $pi$ that appears in oblique position might be unusual in this respect. It is potentially unique to nominalizations with -$na$, since it does not appear as the argument of a postposition elsewhere in the language. There might be some relationship between $pi$- and the so-called emphatic pronoun $pii$. Since independent words in Northern Paiute must be bimoraic in length, it would not be implausible for $pi$- to lengthen to $pii$ when standing on its own.

A semantic connection between the two forms is somewhat more difficult to identify. The emphatic pronoun, as its name suggests, lends emphasis to a DP, either by itself (i) or when it is supported by the enclitic $=su$ (ii) or by $=simi$ ‘alone, only’ (iii).

(i) Oka $pii$ yaa su=toogga-tsi puni-kati.
   3SG.ACC PRO there DEF.NOM=dog-DIM see-STAT
   ‘Now that’s what the dog was looking at, sitting there.’ (prompted narrative, EM, BP25-2-t1, 7)

(ii) Su=naatsi’i $pii=su$ tika.
    DEF.NOM=boy PRO=EMPH eat
    ‘The boy himself is eating.’ (elicitation, EM, BP37-2-s, 16)

(iii) Su=nana $pii=simi$ oo siggwi kati.
   DEF.NOM=man PRO=alone there just sit.DUR
   ‘The man is just sitting there by himself.’ (elicitation, MS, BP33-3-s, 18)

In (i), for instance, $pii$ emphasizes the third-person singular object of the verb, as reflected in the English translation, which is a reverse pseudocleft. In (ii–iii), the emphasis is realized in the English translations in the emphatic use of reflexive anaphors—i.e. the boy himself and the man...by himself. Further investigation is clearly needed to determine whether or not the emphatic pronoun can be identified with the resumptive pronoun.

If a null pronoun does not depend on the presence of a $\lambda$-operator, then it should be possible for a $\lambda$-operator to occur without a pronoun, as long as it is able to find something to bind. I argue elsewhere (Toosarvandani 2011) that it is also possible to bind the variable contributed by a Heimian indefinite.
There is independent evidence that the individual interpretation of nominalization with -na does not arise through A′-movement. Resumptive pronouns have a number of properties that distinguish them from A′-traces: i) absence of weak crossover effects, ii) insensitivity to constraints on movement, and iii) failure to license parasitic gaps. In what follows, I show that the resumptive pronouns inside individual-denoting nominalizations with -na do not exhibit weak crossover (§3.3.1) and that they do not obey the standard constraints on extraction, insofar as they can be tested in Northern Paiute (§3.3.2). The third property above — the failure of resumptive pronouns to license parasitic gaps — is of little use because Northern Paiute has null arguments. Instead, I

As in many other languages, internally headed relative clauses in Northern Paiute, such as (i), are built from nominalizations (Langdon 1977, Culy 1990)—specifically, nominalizations derived by -na.

(i) Kai nii ka=i=bia kammi saa-na tika-kwi.
NEG 1SG.NOM DEF.ACC=1SG.GEN=mother rabbit cook-NMLZ eat-PROSP
‘I won’t eat the rabbit my mother cooked.’ (elicitation, EM, BP32-4-s, 78)

Basilico (1996) shows for a diverse set of languages (Lakhota, Mojave, Mooré, and Northern Athabaskan) that the interpretation of such internally headed relative clauses arises through abstraction over an indefinite DP, which under Heim’s (1982) theory introduce a restricted free variable.

If this analysis can be extended to Northern Paiute, the nominalization in (i) would have a structure completely parallel to the individual-denoting nominalizations in (63a–b):

(ii)

But instead of binding a pronoun, the λ-operator binds a free variable introduced by a Heimian indefinite. This is the object of the verb saa ‘cook’, which is the bare indefinite kammi ‘rabbit’. After combining with the definite determiner, the entire nominalization has the correct individual-denoting meaning:

(iii) \[ \{i \} = t(x)(\text{rabbit}(x) \land \exists e(\text{cook}(x)(e) \land \text{agent(my-mother)}(e))) : e \]

The nominalization in (i) describes an individual—the rabbit cooked by the speaker’s mother—even though there is no obvious gap in the patient argument.

There are languages, such as Swedish (Engdahl 1985) and Vata (Koopman 1992), that have resumptive pronouns which do behave, for all intents and purposes, like the gap created by A′-movement. These might be analyzed as the overt realization of an A′-trace. Other languages, such as English, only allow an ‘intrusive’ resumptive pronoun when extraction is not possible (Chao and Sells 1983, Sells 1984). I will not be concerned with these types of resumptive pronouns.
provide an additional argument based on the antilocality property of resumptive pronouns (§3.3.3).

### 3.3.1 Weak crossover effects

While resumptive pronouns show strong crossover effects, just like the traces of A′-movement, they do not exhibit weak crossover effects (Sells 1984:69–84, McCloskey 1990:236f.). In Northern Paiute, wh-movement does exhibit weak crossover, as shown in (67).

(67)  
(a) Haga₁ t₁ ti-=₁ddua t₁ tika-ggi-ti?  
who REFL=child eat-APPL-TNS  
‘Who₁ fed their₁ child?’ (cf. Who₁ t₁ fed their₁ child?) (elicitation, EM, BP37-3-s, 13)

(b) * Haga₁ t₁ ti-=₁bbia t₁ t₁ tika-ggi-ti?  
who REFL=mother eat-APPL-TNS  
Intended: ‘Who₁ was fed by their₁ mother?’ (cf. *Who₁ did their₁ mother feed t₁?) (elicitation, EM, BP37-3, 32:28)

(c) * Haga₁ u=₁bbia t₁ t₁ tika-ggi-ti?  
who 3SG.Gen=mother eat-APPL-TNS  
Intended: ‘Who₁ was fed by their₁ mother?’ (cf. *Who₁ did their₁ mother feed t₁?) (elicitation, EM, BP43-2, 30:10)

In (67a), the genitive reflexive anaphor t₁ can be bound by a subject wh-phrase when it occurs inside the object. But when the anaphor appears inside the subject, as in (67b), it cannot be bound by an object wh-phrase that has A′-moved past it. The ungrammaticality of (67b) cannot be attributed solely to a violation of Principle A, since the nonreflexive possessive pronoun in (67c) is also ungrammatical in the same crossover configuration.

In contrast, when the genitive reflexive anaphor occurs as the possessor in a nominalization, it can be bound by the operator that binds the (null) resumptive pronoun inside the embedded vP:

(68)  
Ti=bbia mutuhe-na yaka.  
REFL=mother kiss-NMLZ cry.DUR  
‘The one₁ kissed by their₁ mother is crying.’ (cf. *The one who₁ their₁ mother kissed t₁ is crying.) (elicitation, EM, BP37-3-s, 15)

The nominalization in (68) describes the individual who was kissed by the individual’s mother. Its structure is shown below.
This is a weak crossover configuration since the $\lambda$-operator that binds the resumptive pronoun inside the vP also has the genitive reflexive anaphor $ti=1$ in its scope. Such a configuration is ruled out for operators that undergo A′-movement, but it is grammatical for the operators that bind resumptive pronouns.

### 3.3.2 Constraints on movement

Unlike traces of A′-movement, resumptive pronouns also do not obey standard restriction on extraction. Unfortunately, we cannot show this with island constraints in Northern Paiute. The language does not obey the Left Branch Condition (see §2.3.3), and it is not possible to construct the syntactic configurations necessary to test the other islands.

---

23 A reviewer asks how the genitive reflexive anaphor $ti=1$ can be licensed in (68) if it is subject to a constraint like Principle A, since there is no overt DP that binds it. It is not inconceivable that the $\lambda$-operator itself counts as a binder for the purposes of Principle A. In the end, though, a more complex solution will probably be necessary. Even in English there are free occurrences of anaphors inside DPs: e.g. *John was going to get even with Mary. That picture of himself in the paper would really annoy her...* (Reuland 2006:277). Unfortunately, binding in Northern Paiute will have to await future investigation.

24 This is a perhaps surprising but nonetheless real fact. To start, it is not possible to test the Coordinate Structure Constraint because Northern Paiute does not allow coordination structures inside nominalizations. The language does not have overt coordinators; it instead juxtaposes clauses in a type of asyndetic coordination, e.g. (36), with an optional discourse particle, such as *yaisi ‘also, too’*. If we attempt to coordinate two VPs in this way inside a nominalization, it is indeed not possible to bind a variable contained within just one of them, as shown in (i).

---

(i) *Nii [DP $\lambda_1 i=naa’a$] [hubia-du] [yaisi pro$_1$ saa]-na] tika-hu.
   1SG.NOM 1SG.GEN=father song-make PTC cook-NMLZ eat-PUNC
   Intended: ‘I ate what my father cooked while singing.’ (cf. *I ate what$_1$ my father sang and cooked $t_1$.*)
   (elicitation, EM, BP48-1, 20:31)

(ii) *Nii [DP $\lambda_1 i=bia$] [hubia-du] [yaisi nigga]-na] kai pisapi.
    1SG.NOM 1SG.GEN=mother song-make PTC dance-NMLZ NEG like.DUR
    Intended: ‘I don’t like my mother’s singing and dancing.’ (elicitation, EM, BP46-2, 8:47)
There is, however, one constraint on A’-movement that is available. Wh-phrases cannot be extracted from within a PP—that is, postpositions must be pied-piped, as -kuba is in (70a). Stranding the postposition, either by itself (70b) or with the pronoun element pi as its host (70c), is ungrammatical for subject relative clauses or a nominalization with a variable inside its own immediate nominalization. It appears that Northern Paiute simply does not allow the recursive embedding of nominalizations.

However, this does not constitute evidence against my proposal that the variable in nominalizations is contributed by a resumptive pronoun (pro1), rather than the trace of A’-movement. Crucially, the parallel non-island-violating sentences are also ungrammatical. In (ii), there is no variable in either constituent that is abstracted over. In (iii), there is a variable contained inside each constituent in an across-the-board fashion. Yet, both (ii) and (iii) are ungrammatical.

Northern Paiute simply does not allow asyndetic coordinations inside nominalizations. Plausibly, the language might lack a (covert) coordinator for combining constituents small enough to occur inside a nominalization. Such a gap in the syntactic categories that can be coordinated, while not common, is attested in other languages (Haspelmath 2004:12). It is similarly not possible to test the Sentential Subject Constraint. The only way to put a clause in subject position is through nominalization, since to my knowledge there is no way of embedding a bare clause. It is indeed ungrammatical [DP λ₁ i=naa’a [[pro₁ ti-bbatsa] [yaisi pro₁ saa]-na] kai tika.

Intended: ‘I didn’t eat what my father killed and cooked.’ (cf. ‘I didn’t eat what I my father killed t₁ and cooked t₁.)’ (elicitation, EM, BP46-2, 13:44)

But again the parallel non-island-violating sentence in (v) is also ungrammatical, even though each λ-operator binds a variable inside its own immediate nominalization. It appears that Northern Paiute simply does not allow the recursive embedding of nominalizations.

The same problem arises for the Complex NP Constraint. I have found no nouns in Northern Paiute that take clausal complements. But relative clauses can be formed by juxtaposing a nominalization to a noun: a nominalization with -di for subject relative clauses or a nominalization with -na for nonsubject relative clauses (see Toosarvandani 2011 for a more complete treatment). Both in subject relative clauses (vi) and in nonsubject relative clauses (vii), it is not possible for the operator (λ₁) of a nominalization to bind a variable inside the relative clause (pro1).

But again the parallel non-island-violating sentence in (v) is also ungrammatical, even though each λ-operator binds a variable inside its own immediate nominalization. It appears that Northern Paiute simply does not allow the recursive embedding of nominalizations.

The same problem arises for the Complex NP Constraint. I have found no nouns in Northern Paiute that take clausal complements. grammatical.

(70)   a.  **Hi-kuba**1  ii  ka=wihi  t1  tiki?
               what-LOC  2SG.NOM DEF.ACC=knife  put.DUR
      ‘What did you put the knife on?’ (elicitation, MS, BP11-5-s, 20)

                     Intended: ‘I tasted what the man fed to the boy who the woman gave a basket to.’ (cf. *I tasted what1 the
woman gave a basket to the boy2 to whom2 the man fed t1 t2.) (elicitation, EM, BP47-5, 24:23)

But again, it is generally not possible to embed a relative clause inside a nominalization, as shown in (viii) and (ix),
for a subject and nonsubject relative clause, respectively.

      1SG.NOM  DEF.ACC= woman  DEF.ACC=boy pinenut eat-NMLZ give-NMLZ buy-PUNC
      Intended: ‘I bought what the woman gave to the boy who ate pinenuts.’ (cf. *I bought what1 the woman gave t1 to
the boy2 who2 ate pinenuts.) (elicitation, EM, BP47-5, 21:57)

      1SG.NOM  DEF.ACC= woman  DEF.NOM=boy  man  pinenut  feed-NMLZ give-NMLZ buy-PUNC
      Intended: ‘I bought what the woman gave to the boy the man fed pinenuts to.’ (cf. *I bought what1 the woman gave t1 to
the boy2 to whom2 the man fed pinenuts t2.) (elicitation, EM, BP47-5, 23:29)

Again, we cannot use the Complex NP Constraint to test for the presence of resumptive pronouns, because embedding
one nominalization within another is just not possible.

A reviewer asks why Northern Paiute does not allow the recursive embedding of nominalizations in this way. The
crosslinguistic distribution of recursion is a complex topic, of course, which I cannot do justice here. The first thing
to note is that Northern Paiute does have recursion elsewhere in the grammar. A possessor, for instance, can easily be
embedded inside another possessor:

      1SG.NOM  DEF.ACC= Grace  son  horse  kill-PUNC
      ‘I killed Grace’s son’s horse.’ (elicitation, EM, BP32-3-s, 25)

Rather, it is nominalizations specifically that cannot be embedded inside one another. This property, while perhaps
unfamiliar from a European perspective, is attested in other languages.

In Mëbengokre, for instance, Salanova (2011:58) documents that ‘[w]hen multiple subjects are present, multiple
embedding is avoided,’ which he conjectures might arise, ‘because the resulting construction is inherently clumsy
or difficult to process, as it would have several subjects in sequence separated from the predicates with which they
belong.’ In other words, in languages with SOV word order, the recursive embedding of nominalization can result in
multiple central embedding, which is unacceptable (though possibly not ungrammatical) in many languages (Chomsky
1961): cf. *The rat the cat the dog chased killed ate the malt. At first glance, this seems accurately to characterize the
infelicitous sentences in (iv–ix).

On the other hand, there is evidence in the literature on internally headed relative clauses that some languages do
allow the recursive embedding of nominalization: Mojave (xi) and Quechua (xii), for instance. (See fn. 21 for the
treatment of internally headed relative clauses as nominalizations.)

(xi)    [DP [DP Tunay  pi:pa1  t1  ?-u:y:u.-n’]2  hat’coq  t2  k’o:-n’.č]  poš  kaʔa:k-k.
      yesterday person 1-see-DEM dog  bite-DEM-SUBJ cat  kick-TNS
      ‘The man I saw yesterday who the dog bit kicked the cat.’ (Munro 1976:202)

(xii)   [DP Marya  [DP Juan wawa-ta  rikushka-ta]  nishka]  llugshirkha.
       Maria  Juan  child-ACC saw-ACC  said  left
       ‘The child that Maria said that Juan saw left.’ (Cole and Hermon 1994:249)
b. * Hi₁ i  ka=wihi   t₁-kuba tigi-hu? 
   what 2SG.NOM DEF.ACC=knife -LOC put-PUNC
   Intended: ‘What did you put the knife on?’ (elicitation, EM, BP37-3, 19:57)

c. * Hi₁ i  ka=wihi   pi₁-kuba tigi-hu? 
   what 2SG.NOM DEF.ACC=knife PRO-LOC put-PUNC
   Intended: ‘What did you put the knife on?’ (elicitation, EM, BP37-3, 20:45)

Of course, in nominalizations with -na, a preposition can be stranded. That is how they are able to describe an individual that is projected as an oblique argument. Consider, again, the sentence in (71), repeated from (63b) above.

(71) Ka=i=naa’a   pi-kuba kati-na nii   timi-dua.
   DEF.ACC=1SG.GEN=father PRO-LOC sit-NMLZ 1SG.NOM buy-IRR
   ‘I will buy the one my father is sitting on.’ (elicitation, MS, BP34-5-s, 6)

The nominalization describes the argument of a locatival postposition, which is stranded inside the vP. Since a postposition must be pied-piped when its argument has been extracted, the gap in this nominalization must be produced by a resumptive pronoun.

3.3.3 The Highest Subject Restriction

Resumptive pronouns exhibit what McCloskey (1990:210) calls the HIGHEST SUBJECT RESTRICTION. They cannot occupy a subject position immediately subjacent to their binder. The proper analysis of this phenomenon remains controversial, though often it is related to the more general antilocality property of (nonreflexive) pronouns embodied in Principle B (Borer 1984, McCloskey 1990; see McCloskey 2006 for additional discussion and references). I will not attempt to provide a theory of why resumptive pronouns should obey this constraint. I will simply use it to argue that the gap in individual nominalization with -na is created by a resumptive pronoun.

First, we need to figure out how the Highest Subject Restriction applies in the nominal domain. The DP that corresponds to the subject of a clause sits in Spec-PossP. The Highest Subject Restriction states, then, that a resumptive pronoun is not able to occupy this position when the resumptive pronoun’s binder is located within the same subjacency domain. In other words, the following configuration is ruled out by the Highest Subject Restriction:

Notice, however, that the head of an internally headed relative clause in Mojave moves to the left edge of its nominalization (Basilico 1996), so that there ends up being no center embedding in (xi). Similarly, while (xii) looks like a case of center embedding on the surface, Cole and Hermon (1994:248f.) argue convincingly that in Quechua the head of the most deeply embedded internally headed relative clause — the object wawata ‘child (acc.)’ — undergoes movement at LF to the right edge of the higher nominalization (after nishka ‘said’). This eliminates the center embedding in this language as well.

I leave the question of why overt and covert movement are not available to remedy center embedding in languages like Northern Paiute and Mębengokre for the future.
A nominalization with the structure in (72) would describe the highest argument of the embedded verb. However, such nominalizations with a gap in the position of the POSSESSOR are never attested in Northern Paiute:

(73) a. * Niį ka=ti=naa’a tona-hu-na mutuhe-hu.  
1SG.NOM DEF.NOM=REFL=father punch-PUNC-NMLZ kiss-PUNC  
Intended: ‘I kissed the one who punched my father.’ (elicitation, EM, BP37-3, 57:45)  
DEF.NOM=get.drunk-NMLZ fall-PUNC  
Intended: ‘The one who was drunk fell down.’ (elicitation, EM, BP39-2, 1:00:39)  

That is, when nominalizations with -na describe an individual, this must be an argument of the embedded verb that is not the highest argument.

4 The interpretation of nominalizations with -di

Nominalizations that describe the highest argument of the verb are created with the -di nominalizer, regardless of the thematic role of this argument:

(74) a. Su=kutsu patsa-di mia-hu.  
DEF.NOM=cow kill.SG-NMLZ go-PUNC  
‘The one who killed the cow left.’ (elicitation, EM, BP37-1-s, 16)  
b. Su=na-gwitama-di wadzi-mia-hu.  
DEF.NOM=PASS-lock.up-NMLZ hide-go-PUNC  
‘The one who should be locked up ran away.’ (elicitation, MS, BP34-4-s, 24)  
c. Ka=idziggiwa ka=kwopika-winni-di niį ki’a.  
DEF.ACC=blanket DEF.ACC=shiver-STAT-NMLZ 1SG.NOM give.DUR  
‘I gave the blanket to the one who is shivering.’ (elicitation, MS, BP34-3-s, 28)
The nominalization in (74a) describes the agent of the transitive verb *patsa* ‘kill (sg.)’; the one in (74b) the patient of the passive verb *nagwítama* ‘be locked up’; the one in (74c) the patient of the unaccusative verb *kwopika* ‘shiver’; and, the one in (74d) the sole argument of the stative verb *patsiponoa* ‘be round’.

The nominalizations in (74a–d) all have the following schematic structure, where `-di -` is the realization of a Poss head that takes a vP complement:

\[
\begin{array}{c}
\text{DP} \\
\text{D} \\
\text{PossP} \\
\text{vP} \\
\text{Poss} \\
\ldots \text{V} \ldots \\
\text{-di -}
\end{array}
\]

Since there is no T inside these nominalizations and `-di -` does not project a specifier, there is one case too few. In particular, as I discuss in §4.1, there is no case (nominative or genitive) to license an overt DP in the highest argument position of the embedded verb. Consequently, as I show in §4.2, this position is occupied by a phonologically null argument (PRO) that does not need case. It is bound by a λ-operator to give rise to the individual interpretation.\(^{25}\) The event interpretation of nominalizations with `-di -` is restricted to zero-place predicates. This follows from the current account, as I show in §4.3, because the verb’s event argument can only be left unsaturated when it takes no individual-type arguments.

### 4.1 The individual interpretation

The individual nominalization with `-di -` in (74a) has the following structure:

\(^{25}\text{Krause (2001) makes a similar proposal for reduced relative clauses, where the highest argument of a verb raises to be the head of a reduced relative clause because it cannot get nominative case.}\)
(76) 

The direct object *kutsu* ‘cow’ gets accusative case from v. A DP in Spec-vP, however, would be unable to get case. There is no T inside the nominalization, and since *-di* does not project a specifier into which the DP can raise and get genitive case, there simply is no case to assign it. Consequently, this argument of the verb in (76) is projected as a phonologically empty argument that does not need case (PRO; Chomsky 1981).

This nominalization with *-di* describes an individual because PRO is abstracted over by the same λ-operator found in nominalizations with *-na*. The semantic composition of (74a) is shown below.

---

26 A reviewer asks why PRO must be bound in nominalizations with *-di*. In this syntactic context, it cannot receive an arbitrary interpretation, as it can in other contexts, e.g. (97). One possibility is that there must be a λ-operator obligatorily adjoined inside nominalizations, a requirement that not implausibly could be imposed by D. If vacuous binding is not allowed, it would have to find something to bind, which in an individual-denoting nominalization with *-di* can only be the PRO in subject position. But then the question is what happens in event-denoting nominalizations with both *-na* and *-di*, which I have argued do not contain an additional λ-operator. If the predicate’s event argument is always saturated by a free variable—an idea that I discuss in fn. 16—then even in event-denoting nominalization, the λ-operator will have something to bind.
The null argument contributes an individual-type variable (1), which saturates the verb’s external argument. The event argument is existentially bound by Existential Closure at the vP level (2). (Again, I assume that the nominalizer -di denotes the identity function, since it does not contribute to the meaning of the nominalization.) Then, the variable contributed by PRO is abstracted over by a λ-operator that adjoins to the sister of D (3). The resulting set of individuals serves as the argument for the determiner, so that the entire DP refers to the individual who is the agent of the event of killing the cow (4).

The interpretations of the nominalizations in (74b–d), where -di applies to an unaccusative, passive, or stative verb, arise in a similar fashion. These nominalizations are also missing one case, since by Burzio’s Generalization v cannot assign accusative case if it does not assign an external argument theta role. In an ordinary clause, the internal or stative arguments of these verbs would raise to subject position. But in a nominalization with -di, they are realized as PRO, so that the nominalization describes the internal or stative argument.

4.2 Evidence for PRO

We might consider an alternative to PRO. Say that, when the highest argument of the verb is not able to get case, it is simply not projected at all. This would leave that argument of the predicate unsaturated, yielding the same interpretation as λ-abstraction over PRO. There is evidence from the binding of reflexive and nonreflexive pronouns, however, that the highest argument in a nominalization with -di is, in fact, syntactically projected.27

In Northern Paiute, the genitive reflexive anaphor ti= obeys a constraint like Principle A: it

27Baker and Vinokurova (2009:548) use the same argument to support the presence of PRO in so-called agent nominalizations in Gikuyu (Niger-Congo, Bantu: Kenya). Like the -di nominalizer in Northern Paiute, the -i suffix turns a verb into a nominal that describes the verb’s highest argument, e.g. the agent (i). (The numbers in the interlinears for the Gikuyu examples represent noun class, not person.)
must be bound (78a–b). In contrast, the (nonreflexive) genitive proclitic pronoun u= obeys something like Principle B: it must be free in its binding domain (78c).

(78) a. Su=nana\textsubscript{1} ka=ti=\textsubscript{1}ggutsu kwati-hu.
   DEF.NOM=man DEF.ACC=REFL=cow shoot-PUNC
   ‘The man\textsubscript{1} shot his\textsubscript{1} cow.’ (elicitation, EM, BP37-3-s, 32)

b. * Su=nana\textsubscript{1} ka=ti=\textsubscript{2}ggutsu kwati-hu.
   DEF.NOM=man DEF.ACC=REFL=cow shoot-PUNC
   Intended: ‘The man\textsubscript{1} shot his\textsubscript{2} cow.’ (elicitation, MS and EM, BP48-1, 26:22)
   [MS: “Must be the man’s cow.” EM: “He shot his own cow.”]

c. * Su=nana\textsubscript{1} u=\textsubscript{1}ggutsu kwati-hu.
   DEF.NOM=man DEF.ACC=REFL=cow shoot-PUNC
   Intended: ‘The man\textsubscript{1} shot his\textsubscript{1} cow.’ (elicitation, EM, BP37-3, 1:20:20)

The genitive reflexive anaphor and nonreflexive proclitic pronoun have the same referential possibilities in nominalizations with -di:\n
(79) a. Ni-i ka=ti=bbia mutuhe-di pisapi.
   1SG.NOM DEF.ACC=REFL=mother kiss-NMLZ like.DUR
   ‘I like the one\textsubscript{1} who is kissing his\textsubscript{1} mother.’ (elicitation, EM, BP37-3-s, 36)

b. * Ni-i u=bbia mutuhe-di pisapi.
   1SG.NOM 3SG.GEN=mother kiss-NMLZ like.DUR
   Intended: ‘I like the one\textsubscript{1} who is kissing his\textsubscript{1} mother.’ (elicitation, EM, BP37-3, 1:37:20)

This should only be possible if there is another DP inside these nominalizations to bind them. The sentence in (79a) is grammatical since ti-= is bound by a PRO in Spec-vP. Similarly, the sentence in (79b) is ungrammatical under the intended interpretation since u= is not free. It is c-commanded by, and coreferential with, PRO in Spec-vP.\textsuperscript{28}

(i) A-thɨ́nj-i mbũrũ ūru\textsubscript{a} acio nɨ-má-á-tūm-a tū-caamb-e,
2-slaughter-NMLZ 10goats badly 2DEM FOC-2.SBJ-PRF-make-IND 2.SG.SBJ-bad.reputation-SBJV
‘Those (people) who slaughter goats badly have given us a bad reputation.’ (Mugane 2003:237)

They argue (p. 547f.) that these nominalizations do not contain nominative case, so that the highest argument of the verb is realized as PRO. It is able to license a reflexive pronoun (realized as an i- prefix on the verb) in the two nominalizations in (ii).

(ii) Andũ ma-ũ-thũ-fre mɨ-i-end-i ta mũ-ɨ-yamb-i.
2people 2.SBJ-NEG-hate-PRF 1-REFL-like-NMLZ like 1-REFL-pride-NMLZ
‘People don’t hate one who likes himself/herself as much as one who is full of him/herself.’ (Mugane 2003:239)

Baker and Vinokurova write (p. 548) that they ‘suspect that this sort of nominalization [in Gikũyũ] is relatively rare.’ But if it has the same syntax and semantics as nominalizations with -di in Northern Paiute, perhaps it is not so rare after all.

\textsuperscript{28}A reviewer wonders whether (79b) might not be ruled out independently by the i-within-i constraint, which bans the coindexation of an element with a phrase that contains it, i.e. *[\ldots i_1 \ldots]_i (Chomsky 1981:212). On the face of it, this is problematic because the i-within-i constraint would also undesirably rule out (79a), which is grammatical
We should be careful here to distinguish syntactic binding from semantic binding. Under standard assumptions, the distribution of reflexive and nonreflexive pronouns is mediated by syntactic binding, which Binding Theory defines as a relation between DPs (based on c-command and coreference). In contrast, semantic binding is a relation between a λ-operator (or other operator) and a variable. Both reflexive and nonreflexive pronouns can be semantically bound, but only a reflexive pronoun must be syntactically bound. Consequently, even though PRO is semantically bound by a λ-operator in nominalizations with -di, we can use syntactic binding and the distribution of reflexive and nonreflexive pronouns to provide evidence for its presence.  

### 4.3 The event interpretation

When the verb embedded by -di takes one or more individual-type arguments, the highest one cannot get case and must be realized as PRO. By abstracting over the variable it contributes, the nominalization describes an individual, and the verb’s event argument is existentially bound. Say, though, that every individual-type argument were to get case. A nominalization with -di would then describe the verb’s event argument, which would be its highest (and only) argument.

This happens in exactly one circumstance, when the embedded verb takes no individual arguments. If zero-place predicates like weather verbs only take an event argument, then when the -di nominalizer applies to tiiggwa ‘snow’ or pauma ‘rain’, the resulting nominalizations can describe an event:

\[(80) \text{ a. } \text{Nii ka=tiiggwa-di punni.} \]

<table>
<thead>
<tr>
<th>1SG.NOM DEF.ACC=snow-NMLZ see.DUR</th>
</tr>
</thead>
<tbody>
<tr>
<td>‘I see it snowing.’ (elicitation, EM, BP37-2-s, 32)</td>
</tr>
</tbody>
</table>

30 Observe that (80a) forms a near minimal pair with the event nominalization of a weather verb by -na in (49). Under my proposal, they should have the same truth conditions. I do not know, however, whether there are any differences—semantic or pragmatic—between the two types of deverbal nominalization.

I will point out that English also has multiple ways of describing the same event. A perception verb can take as its internal argument a bare infinitival complement (i), a POSS-ing gerund (ii), or an ACC-ing gerund (iii).

(i) I saw him eat the cake.
(ii) I saw his eating the cake.
(iii) I saw him eating the cake.

There is probably some sort of difference amongst these three constructions, even though superficially they appear to have the same truth conditions. I leave this question for future investigation.
b. **Pauma-di** tiśina-hu. 
**rain-NMLZ** stop-PUNC

‘The raining stopped.’ (elicitation, EM, BP33-2-s, 27)

c. Su=nana  **ka=pauma-di** -ggwe  nīka-hu. 
DEF.NOM=man **DEF.ACC=rain-NMLZ**-LOC dance-PUNC

‘The man was dancing during the raining.’ (elicitation, EM, BP32-4-s, 25)

The nominalization in (80a) describes an event of snowing that is perceived by the speaker, and the one in (80b) an event of raining that ends. The nominalization in (80c) is the argument of the postposition -ggwe, which has a temporal sense that locates the raining event described by the nominalization at the same time as the dancing event.

A reviewer wonders whether the nominalizations in (80a–c) might not actually describe individuals. Chomsky (1981:325), for instance, treats the subject of a weather verb as a ‘quasiargument’ that bears a θ-role but does not refer. There are, however, other zero-place predicates, for which this issue do not arise. For instance, in Northern Paiute, (unergative) intransitive verbs can be passivized, as shown for wohi ‘bark’ in (81a–b).

(81) a. Toogga wohi. 
dog bark

‘A dog is barking.’ (elicitation, EM, BP48-1-s14)

b. Na-wohi. 
PASS-bark

‘There is barking.’ (elicitation, EM, BP48-1-s11)

The passive prefix na- removes the sole (agent) argument of wohi ‘bark’. (Consequently, the subject position is empty or is filled by a null expletive pronoun.) This leaves only the verb’s event argument open. As predicted, when the nominalizer -di applies to passivized intransitive verbs, as in (82a–b), the resulting nominalizations denote an event.

(82) a. **Su=na-wohi-di** paba-’yu. 
DEF.NOM=PASS-bark-NMLZ big-NOM

‘The barking is loud.’ (elicitation, MS, BP48-1-s13)

b. Niŋ  **ka=na-wohi-di**  naka. 
1SG.NOM DEF.ACC=PASS-bark-NMLZ hear

‘I hear the barking.’ (elicitation, MS, BP48-1-s12)

The sentence in (82a) entails that an event of barking is loud. And, the sentence in (82b) entails that the speaker perceives an event of barking through hearing.

The semantic composition of the event nominalizations in (80a–c) and (82a–b) starts out in a nearly identical fashion to the individual nominalizations. This is illustrated for (80a) in the following parsetree:
The verb denotes a set of events (1). In a clause the event argument would be existentially bound, but since the definite determiner ka= requires a set of entities as its argument (2), the Existential Closure operation does not apply. The entire DP thus refers to the event of its snowing (3).

The nominalizer -di does not project a specifier and does not make an additional genitive case available. This consequently produces an individual interpretation when the highest argument of the verb is realized without case as a null argument that is abstracted over (PRO). It can only have an event interpretation when the verb takes no individual-type arguments.

5 How English is (not) like Northern Paiute

While deverbal nominalizations in Northern Paiute can have either an event or an individual interpretation, why do parallel nominalization patterns in other languages not exhibit the same variability? Consider the two English nominalization patterns from the introduction: the POSS-ing gerund, illustrated in (84a), and agent nominalizations with -er, illustrated in (84b).

(84) a. I witnessed Caesar’s burning the city.
   b. The seller of counterfeit stock was jailed.

The POSS-ing gerund can only describe an event — never an individual — while the agent nominalization can only describe an individual. Below I explore why English is different from Northern Paiute in this respect.

The POSS-ing gerund, I argue in §5.1, has the same basic structure as a nominalization with -na. But it only describes events because English lacks the system of operators and resumptive pronouns that give rise to the individual interpretation in Northern Paiute. In contrast, while the -er nominalizer in English might bear a passing similarity to -di in Northern Paiute, I show in §5.2 that its syntax and semantics are actually quite different. An event interpretation is never possible since the verb’s event argument is closed off by the nominalizer suffix itself.

5.1 The POSS-ing gerund

Though there are many analyses of the POSS-ing gerund in English, most generative approaches take the -ing suffix to realize some kind of head in the extended nominal projection. Early accounts assumed that it was an N that takes a verb phrase complement (Horn 1975, Jackendoff 1977:222f.). This seems unlikely, though, since -ing does not have the right kind of meaning for a

31 There are alternatives. For instance, gerunds could not be endocentric (Schachter 1976, Pullum 1991), or they could have the features of both nouns and verbs (Malouf 2000a,b, Hudson 2003), or the -ing suffix (or some abstract correlate of it) could be adjoined to a verb phrase (Abney 1987:241–244, Yoon 1996). For reasons of space, I set these possibilities aside.
noun (it does not denote a set of entities like a common noun). Instead, we might think that -ing is a D. But Abney (1987:193–209) rejects this possibility because it is able to cooccur with the Saxon genitive ’s, which is in complementary distribution with other determiners.

Baker (2005) proposes that the -ing suffix in POSS-ing gerunds realizes a nominal functional head somewhere between N and D that is the nominal equivalent of T (or Infl) (see the earlier work of Baker 1985 and Milsark 1988 as well). Since this is precisely the position and function of the Poss head, I propose that -ing realizes the Poss head when it takes a vP complement. Like -na in Northern Paiute, it projects a specifier where possessors are assigned case. Under this analysis, the POSS-ing gerund in (84a) has the following structure:

(85) \[ \text{DP} \]
   \[ \text{DP}_1 \]
   \[ \text{Caesar} \]
   \[ \text{D} \]
   \[ \text{PossP} \]
   \[ \text{'s} \]
   \[ \text{t}_1 \]
   \[ \text{Poss'} \]
   \[ \text{Poss} \]
   \[ \text{vP} \]
   \[ \text{-ing} \]
   \[ \text{t}_1 \]
   \[ \text{v'} \]
   \[ \text{v} \]
   \[ \text{VP} \]
   \[ \text{V} \]
   \[ \text{burn} \]
   \[ \text{the city} \]

The external argument of the embedded verb raises to Spec-PossP, where it receives case, before raising to its surface position in Spec-DP, as Abney (1987:79) proposes. Just as we would expect if the POSS-ing gerund contains a vP, it assigns accusative case to the direct object, and it can include verbal modifiers such as manner adverbs (Caesar's quickly burning the city) (Abney 1987:182). Yet, the POSS-ing gerund does not assign nominative case to the highest argument of the base verb—what would be the subject in a clause— which is instead realized as a possessor.

If -ing is indeed the overt realization of the Poss head, POSS-ing gerunds should have the same properties that we saw nominalizations with -na do: i) they should be able to contain nominal categories located above Poss; ii) they should take an obligatory possessor; and, iii) they should have an event interpretation. Below, I show that POSS-ing gerunds have all three properties.

It is important to note that I am proposing the structure in (85) only for the POSS-ing gerund. It is not necessarily suitable for other deverbal nominalizations created by the -ing suffix, such as the ACC-ing gerund in (86) or derived nominals like (87).

(86) I witnessed Caesar burning the city.
(87) I witnessed Caesar’s burning of the city.

There have been attempts to unify the ACC-ing gerund and derived nominals with the POSS-ing gerund. For example, Abney (1987:222–230) proposes that the same -ing suffix creates all three nominalization patterns. The two gerunds would embed a somewhat larger verbal constituent,
while derived nominals would embed a smaller one, possibly just the verb (though see Alexiadou 2001 and Borer 2003). Except for some tentative suggestions in footnote 33 towards assigning the ACC-ing gerund the structure in (85), I set these other nominalization patterns aside to focus just on the POSS-ing gerund.

5.1.1 Other nominal categories inside POSS-ing gerunds

If -ing realizes the Poss head, POSS-ing gerunds should be able to contain functional categories located above Poss in the extended nominal projection. The two main candidates are Num and D, both of which can appear inside a possessive description:

(88) John’s dogs scared me.

Num is realized as the plural -s suffix on the head noun, and D as the Saxon genitive ’s (Abney 1987:79).

It is not possible for the plural suffix— and hence Num—to appear inside a POSS-ing gerund:

(89) * I witnessed Caesar’s burnings the city.

But this restriction arises for independent reasons. Borer (2005:239–245) shows that other event nominalizations can only bear plural marking when the embedded predicate is telic:

(90) a. the pilot’s crossings of the Pacific
    b. # the team’s swimming of laps

The predicate cross the Pacific has an inherent end point, while swim laps has no inherent end point. While derived nominals inherit the telicity of the embedded predicate, Alexiadou et al. (2010:552–556) argue that POSS-ing gerunds are always atelic.32 Consequently, they do not allow plural marking for independent reasons, and the ungrammaticality of (89) tells us nothing about the structure of the POSS-ing gerund.

Assuming that ’s is a determiner, we have already seen that D can appear inside POSS-ing gerunds. But this is the only determiner that can appear inside possessive descriptions in English, and hence also in POSS-ing gerunds. This contrasts with Northern Paiute, which allows the definite determiners su= and ka= inside both its possessive descriptions and its nominalizations with -na and -di (see §2.2).33

32I leave for future research where this aspectual contribution comes from. Alexiadou et al. observe (p. 554 fn. 15) that it does not come from the -ing suffix itself. This makes sense if it realizes the Poss head, which I am arguing is semantically contentless.

33There might be one other determiner besides ’s that appears inside nominalizations with -ing. In the ACC-ing gerund in (i), ’s is absent, and when the external argument is a pronoun, it bears accusative case.

(i) { John Him } building the bridge ruined the company.

The traditional story, as told by Abney (1987:222–231), is that the POSS-ing gerund embeds a smaller constituent, such as a vP, while the ACC-ing gerund embeds a full clause, a TP. Portner (1992:88–145) shows convincingly, however, that ACC-ing and POSS-ing gerunds do not embed different-sized verbal constituents. He attributes their differences in structure and interpretation to a contrast in DEFINITENESS. While the POSS-ing is headed by the definite determiner ’s, the ACC-ing gerund is headed by a null indefinite de-
5.1.2 An obligatory possessor inside POSS-ing gerunds

If -ing realizes Poss when it projects a specifier, then POSS-ing gerunds should always contain a possessor. This is indeed the case, as Abney (1987:183) observes. The possessor in a POSS-ing gerund cannot be omitted (91), unlike the possessor in either a possessive description (92a) or a derived nominal (92b).

(91) I witnessed \{ \begin{array}{l} \text{Caesar's} \\ \ast \text{the} \end{array} \} burning the city.

(92) a. I witnessed \{ \begin{array}{l} \text{John's} \\ \text{the} \end{array} \} will.
   b. I witnessed \{ \begin{array}{l} \text{John's} \\ \text{the} \end{array} \} construction of the house.

It is tempting to attribute the ungrammaticality of the POSS-ing gerund without a possessor in (91) entirely to the failure of the embedded verb’s external argument to project (a violation of the Theta Criterion). Baker (1985:7) observes, however, that predicates with no unsaturated arguments—such as a weather verb (93a) or a predicate like be certain that does not assign a theta role to its subject (93b)—can occur in a POSS-ing gerund.

(93) a. I am disappointed by \{ \begin{array}{l} \text{its} \\ \ast \text{the} \end{array} \} raining all day.
   b. I am disappointed by \{ \begin{array}{l} \text{its} \\ \ast \text{the} \end{array} \} being certain that she’ll quit. (Baker 1985:7)

There is some dispute about whether these examples are grammatical (Abney 1986:16, Abney 1987:208). But there are plenty of naturally occurring examples of both types:

(94) a. The idea is said to have originated in its raining on the day on which it was intended to remove his remains…\(^{34}\)
   b. Moreover, and this is part of Strawson’s Point, indignation differs from its seeming that a sanction would be desirable…\(^{35}\)

The predicates embedded in these POSS-ing gerunds in (93–94) take no arguments that need case. Nonetheless, they must have a possessor, even if it is nothing more than the expletive pronoun its.

5.1.3 An event interpretation for POSS-ing gerunds

If -ing realizes the Poss head in POSS-ing gerunds, then they should be able to describe an event. This is the interpretation that we saw in §3.2 comes for free when all the embedded predicate’s individual arguments are saturated:

\[
\text{(95) } \lambda e'(\text{burn}((e')^{\prime}) \land \text{agent}(caesar)(e')) : s
\]

The embedded predicate of the POSS-ing gerund in (84a) only has its event argument left open (\(\lambda_1\)). It would be existentially bound in a clause, but inside a nominalization the event argument is instead bound by the determiner (\(\lambda\)). Abstraction over the trace of the external argument, which has raised to Spec-DP, creates a function from individuals to events (ignoring the intermediate trace in Spec-PossP) (\(\lambda_2\)). This function applies to the external argument in Spec-DP, so that the gerund describes the event of Caesar burning the city (\(\lambda_3\)).

The POSS-ing gerund does not have an individual interpretation like nominalizations with -na in Northern Paiute because English has no way of constructing the relevant kind of dependency inside nominalizations. It lacks true resumptive pronouns, as resumption is only used as a rescue strategy when movement is not possible (Chao and Sells 1983, Sells 1984). Consequently, it is not possible for an internal argument of the verb in a POSS-ing gerund to be gapped, regardless of whether this gap is null or overt:

\[
\text{(96) } * \text{I witnessed } \begin{cases} \text{Caesar’s burning} \\ \text{Caesar’s burning it} \end{cases}.
\]

Intended: ‘I witnessed what Caesar burnt.’

In addition, English also lacks the operators that would abstract over a resumptive pronoun. After all, there are some variable-denoting expressions that can appear inside the POSS-ing gerund. The subject can be gapped, as shown in (97), yet no individual interpretation is possible.

\[
\text{(97) Finding oneself is hard work.}
\]
Assuming that the external argument of the verb here is saturated by PRO (Abney 1987:168), the gerund would describe an individual if a λ-operator in English could bind it. But there must be no such operator in English because PRO receives an arbitrary interpretation and the gerund describes an event.

In sum, the POSS-ing gerund has essentially the same structure as a nominalization with -na in Northern Paiute. It does not exhibit the same interpretive variability, though, because English does not have the system of resumptive pronouns and operators to bind them that would give rise to an individual interpretation. Consequently, the POSS-ing gerund only has an event interpretation.

5.2 The agent nominalization in English

At first glance, agent nominalizations with -er in English might look parallel to nominalizations with -di in Northern Paiute. They actually diverge quite significantly in both their syntax and their semantics.

The agent nominalizations created by -er are significantly less verb-like than the POSS-ing gerund in English: i) they cannot assign accusative case to the direct object (*the seller the counterfeit stock); and, ii) they cannot be modified by adverbs (*the frequently seller of the counterfeit stock). In contrast, nominalizations with -di pattern with the POSS-ing gerund in these respects—see §2.

Moreover, nominalizations with -er describe individuals bearing a restricted set of theta roles. In (98), repeated from (84b) above, the nominalization describes the agent of the embedded verb.

(98) The seller of counterfeit stock was jailed.

Rappaport Hovav and Levin (1992) show that -er creates nominalizations that describe any external argument theta role, as shown in (99a–c). But they can NEVER describe an internal argument. The nominalizations of unaccusative verbs in (100) are all ungrammatical.

(99) a. The banya as an institution struck me as one of the few great levelers of Soviet society.
    b. If you are the holder of a Visa or MasterCard charge card, you know they are accepted at hotels…
    c. Jobs are the best indicator of a sound economy.

(Rappaport Hovav and Levin 1992:130f.)

(Rappaport Hovav and Levin 1992:148)

This contrasts strikingly with -di, which we saw in §4 applies to both unaccusative and passive verbs to create nominalizations that describe an internal argument.

To account for its properties, Baker and Vinokurova (2009) propose that -er realizes a nominal functional head, which I will call n, that introduces an external argument theta role (see also Bowers 2011:1200ff.):
The -er nominalizer realizes this n head when it takes a VP complement. This derives the syntactic properties of agent nominalizations. Since v is not present inside this nominalization, the internal argument must be projected inside a PP and there can be no left-edge adverbs.

Baker and Vinokurova’s proposal accounts for why agent nominalizations only have an individual interpretation. Unlike both the -na and -di nominalizers in Northern Paiute and -ing in English, the -er suffix itself contributes the agent theta role in agent nominalizations (G is the generic operator):

$$\text{-[er]} = \lambda f \lambda x \text{Ge}(f(e) \land \text{agent}(x)(e)) : \langle<s,t>,e,t\rangle$$

(102)

Simplifying Baker and Vinokurova’s lexical entry (p. 531) somewhat, the -er nominalizer takes a property of events and returns the set of individuals who are generic agents in those events. The nominalization in (101) consequently describes the individual who is the agent of an event of building the bridge. It can never have an event interpretation because the event argument of the verb is closed off through generic quantification by the -er suffix itself.

6 Conclusion

Northern Paiute has two types of deverbal nominalization that have the internal structure of a vP and the external distribution of a DP. Unlike similar patterns of nominalization in English, these can describe either an event or an individual. I have proposed that this range of interpretations arises through the interaction of the syntax of the nominalizers themselves, on the one hand, and the presence of operators that can abstract over a variable, on the other hand.

If the -na and -di nominalizers in Northern Paiute realize Poss, the nominal functional head that canonically assigns genitive case, the event interpretation comes for free in a certain sense. Under a Davidsonian event semantics, the verb takes an event argument that can remain unsaturated in these nominalizations. In contrast, in agent nominalizations in English, there is never an event interpretation because the -er nominalizer itself binds of the event variable of the verb.

36Baker and Vinokurova actually give the lexical entry for -er in (i), where ⌈ is Chierchia’s nominalization operator. It is a function from properties of events to the individual correlate of the property of usually being the agent in such events:

$$\text{[[-er]]} = \lambda f \lambda x \text{Ge}(f(e) \land \text{agent}(x)(e)) : \langle<s,t>,e\rangle$$

(101)

In this denotation, the -er nominalizer returns an individual correlate as opposed to a predicate. By bringing the property of being an agent down to its individual correlate with the ⌈ operator, the determiner would have to encode the inverse ⌈ operator to raise the individual correlate to a predicate again, in the way that Chierchia (1998) describes.
The individual interpretations for deverbal nominalizations in Northern Paiute arise because the language has operators inside the DP that can abstract over a variable-contributing expression. For nominalizations with -na, the variable is contributed by a pronoun, which can occur anywhere except as the highest argument of the verb. In POSS-ing gerunds, which otherwise have a nearly identical structure, only an event interpretation is possible because English lacks the operators and resumptive pronouns needed to construct an individual interpretation. For nominalizations with -di, the variable is contributed by a phonologically null element that does not need to be get case (PRO), which is projected as the highest argument of the verb.

Deverbal nominalizations comprise a diverse class across languages. As we have seen, however, despite variability in both their structure and interpretation, there are patterns and regularities, which I have sought to capture in the syntax of nominalizers themselves and the semantic resources available in a language.
