Subject Float, Low Subject Trapping, and Case in Icelandic

Halldór Ármann Sigurðsson
Lund University

Abstract
This article describes and discusses two peculiar sets of (in)definiteness facts applying to subjects in Icelandic, here referred to as Subject Float and Low Subject Trapping. Indefinite subjects (commonly quantified) in presentational sentences and related clause types may either occupy the complement position within the predicate phrase or “float” into various positions in the middle field. This is Subject Float, yielding variation such as “There would (many farmers) then (many farmers) probably (many farmers) be (?*many farmers) elected (many farmers)”. Conversely, and unexpectedly, definite NP subjects of some adjectival and verbal predicates must stay in the complement position. This is Low Subject Trapping, yielding orders such as “there is cold radiator-the” and “there cooled radiator-the”. It is shown that the licensing of subject NPs in the various positions in Subject Float and in the complement position in Low Subject Trapping is unrelated to specific cases, thus refuting the widely adopted case approach to NP-licensing. While high NP raising to subject (Spec,IP) is unaffected by case, it seems to involve both Person and Topic matching.

1. Introduction*
The Definiteness Effect or the Indefiniteness Requirement (Thrúmsson 2007) refers to the fact that “late subjects” or expletive associates must be indefinite in examples such as (1) and (2).

(1)  a. There is a man in the garden.
     b. *There is the man in the garden.

(2)  a. There has probably been a farmer elected to the board.
     b. *There has probably been the farmer elected to the board.

A peculiar fact is that English requires raising of the associate into the vicinity (or the “complement position”) of be, as illustrated in (3).

(3)  a. There have been three books, written  , about this. (Holmberg 2002:86)
     b. *There have been written three books about this.

As discussed by Vikner in his 1995 volume, and also by Holmberg (2002), the Scandinavian languages behave differently. For one thing, they allow the associate to stay in the object position, as illustrated for Swedish in (4a) and for Icelandic in (4b).†

(4)  a. Det har blivit skrivet tre böcker om detta. (Holmberg 2002:86)
    there has been written three books about this
    b. Það hafa verið skrifað þrjár bækur um þetta. (Holmberg 2002:86)
    there has been written three books about this

* For discussions and remarks, I am grateful to Anders Holmberg, Einar Freyr Sigurðsson, Elisabet Engdahl, and Gunilla Lindholm.
† Swedish has two types of passives, a periphrastic one (e.g., bli skrivet ‘be written’) and a morphological s-passive (e.g., skrivas ‘be written’). As discussed by Engdahl (2017), the order V-NP, with the associate in the object position, is much rarer and more marked in periphrastic passives than in s-passives; it usually requires rather special contexts. The relevant point is that Scandinavian languages allow indefinite associates to stay in the object position in passives, albeit under somewhat varying conditions.
Both: ‘There have been three books written about this.’

All the Scandinavian languages observe (a version of) the Indefiniteness Requirement, though. See (5a) for Swedish and (5b) for Icelandic.

   there have been written books-the/them

   there have been written books-the/them

The canonical declarative subject positions in Icelandic, as in other Scandinavian languages, are the preverbal position in direct word order (“John arrived yesterday”; “John had arrived yesterday”) or the position immediately following the finite verb in inverted orders (“Yesterday arrived John”, “Yesterday had John arrived”). However, Icelandic displays two sets of peculiar and poorly understood (in)definiteness facts applying to subjects. First, quantified indefinite subjects can “float” and show up in various positions in the middle field above (to the left of) the vP or the predicate phrase. Second, certain definite NP subjects must stay within the predicate phrase, a sort of an anti-definiteness effect. I refer to these phenomena as Subject Float and Low Subject Trapping. I will describe these phenomena here. Even though they have to some extent been discussed in the extensive literature on Icelandic syntax a more detailed and precise description is called for. I aim to provide such a description here.

As we will see, the described facts speak very clearly against the widely adopted assumption that specific cases (abstract or not) account for the positional licensing of NPs; in particular, it has been assumed that subjects move to the canonical subject position (Spec,IP) “in order” to get nominative case, overt or abstract. This assumption, Vergnaud’s conjecture, goes back to Jean-Roger Vergnaud’s famous 1977 letter to Chomsky and Lasnik and was developed in Chomsky’s Lectures on government and binding (1981). Possibly, though, NPs are partly licensed by having some case, regardless of which. However, that is a very general and vague idea, hard or impossible to test. Vergnaud’s conjecture, on the other hand, was a scientific hypothesis in the sense that it is possible to test. When put to a test, however, it fails. This has been argued previously by many, on the basis of Icelandic facts (see H. Sigurðsson 2012 and the references there). This article adds further evidence that Vergnaud’s conjecture was on the wrong track and must be rejected; an alternative account of NP-licensing must be sought for.3

2. Subject Float

A well-known fact is that quantifiers can float, showing up in various positions in the clause (Sportiche 1988, Bošković 2004). This applies to clauses with all major types of verbs in Icelandic, including transitive, unergative, unaccusative/ergative, and passive verbs. I illustrate this for a passive predicate in (6) and (7).

(6) a. Allar stelpurnar mundu þá sennilega hafa verið kosnar.
   all girls-the would then probably have been elected
   ‘All the girls would then probably have been elected.’

b. Stelpurnar mundu allar þá sennilega hafa verið kosnar.

c. Stelpurnar mundu þá allar sennilega hafa verið kosnar.

d. Stelpurnar mundu þá sennilega allar hafa verið kosnar.

e. *Stelpurnar mundu þá sennilega hafa allar verið kosnar.

---

2 The predicate phrase contains the main verb and its complements, plus non-finite auxiliaries, to the exclusion of sentence adverbials in the middle field. The boundary between the predicate phrase and the middle field is blurred by finite verb raising when the finite verb is the main verb. If we assume that auxiliaries are adjoined to vP, the predicate phrase is larger than vP, but if they are stacked little vs the resulting extended vP is equivalent with the predicate phrase (to the exclusion of the raised finite verb).

3 It is not a coincidence that case has played such a central role in generative syntax. Case does not pose immediately obvious or acute problems for the credo that syntax is context free, while other major grammatical categories do, including Person, Tense, Mood, and Gender.
(7) … would 1__ then 2__ probably 3__ have 4__ been 5__ elected 6__
    ok      ok       ok     ?*   ?*    ?*

The potential positions between nonfinite verbs do not easily tolerate lexical material (with the partial exception of negative polarity items), so I will largely disregard these in the following. As for the sentence adverbials, one might want to assume that they come from another dimension than arguments and verbs, in a multi-dimensional approach to phrase structure (see the discussion in Bobaljik 1999, and the references there). I do not take a stand on this issue here. The only thing regarding sentence adverbials that matters for my purposes is that their order is strict, and that quantifiers and quantified subjects can be interspersed between them.

Indefinite subjects that contain a quantifier or consist of a bare quantifier show similar distributional properties as does the quantifier in (6). This is illustrated in (8) and (9).

(8) a. Það mundu margir bændur þá sennilega verða kosnir í stjórnina.
     ‘There would then probably be many farmers elected to the board.’
     ‘Many farmers would then probably be elected to the board.’
     (yielding the same surface order as does the quantifier in (6). This is illustrated in (8) and (9).

b. Það mundu þá margir bændur sennilega verða kosnir í stjórnina.

c. Það mundu þá sennilega margir bændur verða kosnir í stjórnina.

d. ?*Það mundu þá sennilega verða margir bændur kosnir í stjórnina.

e. Það mundu þá sennilega verða kosnir margir bændur í stjórnina.

(9) a. Það mundu margir þá sennilega verða kosnir í stjórnina.
     ‘There would then probably be many elected to the board.’
     ‘Many would then probably be elected to the board.’
     (yielding the same surface order as the many farmers” I set this aside.

b. Það mundu þá margir sennilega verða kosnir í stjórnina.

c. Það mundu þá sennilega margir verða kosnir í stjórnina.

d. ?*Það mundu þá sennilega verða margir kosnir í stjórnina.

e. Það mundu þá sennilega verða kosnir margir í stjórnina.

Expletive það ‘there, it’ is not a subject in Icelandic but a placeholder in the C-domain (see Thráinsson 1979, Platzack 1983, and many others since, including Engdahl et al. 2018). According to the analysis in H. Sigurðsdóttir & Eythórsson (2010), the expletive is in the low C-domain in both main and subordinate clauses. As we will see, Subject Float is independent of the presence of the expletive. The floating NP in Subject Float constructions is the subject.

Margir in (9) and margir bændur in (8) may either have a specific or an unspecific reading. It is difficult to distinguish between these readings, but my intuition is that only the unspecific reading is available in (8e) and (9e), where the subject is in the object position. When the subject is in the highest

4 The heavier quantifier allar með tölu, lit. “all in number”, meaning roughly ‘each and every(one)’, can be right adjoined to the VP or the clause (yielding the same surface order as (6g)). I set this aside.

5 Margir bændur can also be heavy NP-shifted to the right of the VP (or the clause), yielding the order “there would then probably be elected to board-the many farmers”. I set this aside. I am not concerned with transitive expletive constructions here (see, e.g., Thráinsson 2007), but they show largely similar patterns: “There would (many farmers) then (many farmers) probably (many farmers) have (*many farmers) read (*many farmers) book-the (?many farmers)”.

6 It is often unclear whether to translate expletive það as ‘there’ or ‘it’ (and, more generally, how to translate Icelandic impersonal constructions). For simplicity, I consistently use ‘there’ in the glosses.

7 Alternatively, one might want to assume that impersonal and presentational constructions have an expletive null-subject in Spec,VP that forms a chain with the overt subject NP (and presumably also with the expletive, when it is present, in the spirit of Safir 1985). I do not take a stand on this issue here but see Sigurðardóttir & Eythórsson (2017) and Wood (2017) for discussions of related ideas.
position, as in (8a) and (9a), I only get the specific reading, while I get both readings for the middle field positions in the b- and c-examples.

Similar facts apply to some other quantifiers, including, *nokkrir* ‘a few (people), *einhverjir* ‘some (people)’ and numerals like *fjörir* ‘four’, while other quantifiers, including *sumir* ‘some (people)’ and *allir* ‘everybody, all (people)’ behave slightly differently (bare *sumir* and *allir* are for example awkward in the object position). I will not try to sort this out here; it would take us too far.\(^9\)

Bare indefinites behave differently from quantifier subjects; they are usually only “happy” in the object position, as illustrated in (10).

(10) a. ??Pað mundu *bændur* þá sennilega verða kosnir í stjórnina.
   there would farmers then probably be(come) elected in board-the
   Intended: ‘Some (unspecific) farmers would then be elected to the board.’
   b. *Pað mundu þá *bændur* sennilega verða kosnir í stjórnina.
   c. *Pað mundu þá sennilega *bændur* verða kosnir í stjórnina.
   d. *Pað mundu þá sennilega verða *bændur* kosnir í stjórnina.
   e. *Pað mundu þá sennilega verða kosnir *bændur* í stjórnina.

Much the same applies to indefinite subjects that are modified by an adjective, such as *duglegir bændur* ‘efficient farmers’, *gamlir bændur* ‘old farmers’.\(^10\)

The basic structure of vPs in languages like English and the Germanic VO languages is commonly assumed to be as sketched in (11).

(11) [\(\text{VP Specifier} \) v \(\text{VP V Complement}()\)]

Subjects of unaccusatives and passives are taken to be generated in the complement position, to the right of the main verb. Transitive subjects, in turn, are assumed to be generated in the specifier position, Spec,\(\text{vP}\), that is, the position to the immediate left of the main verb. However, as in many other languages (see Alexiadou & Anagnostopoulou 2001), transitive subjects are not usually allowed to surface in Spec,\(\text{vP}\) in Icelandic. This is illustrated in (12).

(12) a. *Pað mundu *margir (bændur) hafa keypt bókina.
   there would many (farmers) have bought book-the
   ‘Many (farmers) would have bought the book.’
   ‘There are many (farmers) who have bought the book.’
   b. *Pað mundu hafa *margir (bændur) keypt bókina.
   there would have many (farmers) bought book-the

Quantifiers and quantified subjects are usually not “happy” in Spec,\(\text{vP}\) in passives and unaccusatives either. We see this in the passives in (8d), (9d), and (10d) above, and we see the same for the unaccusative *hverfa* ‘disappear’ in (13d).

(13) a. *Pað mundu *margir bilar þá sennilega hafa horfið.
   there would many cars then probably have disappeared
   ‘Probably, many cars would then have disappeared.’
   b. *Pað mundu þá *margir bilar sennilega hafa horfið.
   c. *Pað mundu þá sennilega *margir bilar hafa horfið.
   d. *Pað mundu þá sennilega hafa *margir bilar horfið.

\(^8\) Bare *margir* in (9e) is also a bit marked (while, e.g., *mjög margir* ‘very many’ feels entirely natural in the object position).

\(^9\) Another complicating factor that I will not discuss here either is that the judgments change if one adds more sentence adverbials in the middle field, for example the hearsay evidentiality marker *víst* ‘they say, allegedly’ (yielding *þá *víst *þá sennilega *…*) and the negation *ekki* (yielding *þá *(_*víst* *…*) sennilega _*ekki*_ *…*).

\(^10\) However, in clauses with *vera* ‘be’ as the main verb, adjectival modification has grammaticality effects. See the discussion in Thráinsson (2007:318–322) of the different behavior of *kötta* ‘a cat’ vs. *svartur köttur* ‘a black cat’.  

4
However, negative polarity items behave differently. They are relatively “comfortable” in Spec,vP, in particular if they are focalized.\(^\text{11}\) See (14).\(^\text{12}\)

(14) a. \(\text{Það mundu þá sennilega hafa horfð} \text{ margir bílar.} \)
there would then probably not have any farmers elected to the board.

b. \(\text{Það mundu þá sennilega ekki hafa NEINIR það kosnir í stjórnina.} \)
‘Probably, there would then not have been any farmers elected.’

c. \(\text{Það mundu þá sennilega ekki hafa NEINIR bílar horfð.} \)
‘Probably, no cars would then have disappeared.’

Spec,vP is commonly accessible for indefinite subjects in passives in for example English and Swedish (usually under a participle number agreement condition in the latter, see Holmberg 2002). The limited access of floating quantifiers and indefinite subjects to Spec,vP in Icelandic is curious.\(^\text{13}\) In contrast, in English and Swedish, indefinite subjects cannot usually raise into the middle field, that is, the postverbal I-domain, as opposed to Icelandic (see, e.g., Engdahl et al. 2018).\(^\text{14}\) I set these differences aside here.

The Subject Float examples we have looked at so far have the expletive \(\text{það}\) in initial position. However, Icelandic Subject Float is largely independent of the expletive, and, more generally, of the initial position. I illustrate this for only the lowest I-domain position in (15); the sentence in (15c) is a narrative style verb-initial declarative (see H. Sigurðsson 1990, 2018).

(15) a. \(\text{Því mundu þá kannski margir það kosnir í stjórnina.} \)
‘Thus, there would perhaps be many farmers elected to the board.’

b. \(\text{Mundu þá kannski margir það kosnir í stjórnina?} \)
‘Would there then perhaps be many farmers elected to the board?’

c. \(\text{Mundu því kannski margir það kosnir í stjórnina.} \)
‘Thus, there would perhaps be many farmers elected to the board.’

d. \(\text{… að þá mundu kannski margir það kosnir í stjórnina.} \)
‘… that then would perhaps be many farmers elected to the board-the’

Now, reconsider (8), repeated here as (16).

(16) a. \(\text{Það mundu margir það sennilega verða kosnir í stjórnina.} \)
‘There would then perhaps be any cars disappeared.’

e. \(\text{Það mundu þá sennilega hafa horfð} \text{ margir bílar.} \)
‘Probably, no cars would then have disappeared.’

\(\text{11}\) This is marked, though. In all three examples in (14) the order “there would then probably not any farmers have …”, with “any farmers” in the middle field, is more natural (and does not require strong focus). Also, \(\text{neinir}\) alone is ungrammatical in Spec,vP (“there would then probably not have any bought book-the”, etc.). The facts in (14) might relate to the fact that negative objects are commonly raised in the Scandinavian languages (see Thráinsson 2007:82 ff. and the references there), yielding orders like “I have no books bought”.

\(\text{12}\) More generally, the negation affects judgments of Subject Float clauses (see H. Sigurðsson 2000:83), but, as this is presumably due to independent scope effects (rather than the float itself), I set it aside.

\(\text{13}\) One could say that the participle has an EPP [Extended Projection Principle] feature in English and Swedish, attracting the subject into Spec,vP, while Icelandic lacks such a feature (see Holmberg 2002). However, unless one has a general theory of EPP, that is just a restatement of the facts.

\(\text{14}\) “I” in “I-domain” refers to Infl, the position of the finite verb (when it does not raise to C). The postverbal I-domain is the space between the finite verb and the highest or the first non-finite verb. In “there would then probably not many farmers be elected to board-the”, “then”, “probably”, “not”, and “many farmers” are all in the postverbal I-domain, while “be”, “elected”, and “to board-the” are within the predicate phrase.
In these works have been widely discussed. See for example Thráinsson (2007), H. Sigurðsson (2012), and the references cited. Also, H. Sigurðsson 2008, 2009, and many others since. Other positions in the I-domain are low(er) I-domain positions. These are entirely descriptive terms; the high I-domain positions in inverted orders and in presentational sentences are probably distinct (this has been debated, but I set it aside here).

Since Chomsky 1981, it has been widely assumed that subject movement to Spec,IP, as in the dative subject position is the position immediately following the finite verb in main clauses, occupied by definite subjects in inverted orders, as in “Then would farmers-the probably have been elected”, and by indefinite subjects in orders like “There would many farmers then probably have been elected”. The other positions in the I-domain are low(er) I-domain positions. These are entirely descriptive terms; the high I-domain positions in inverted orders and in presentational sentences are probably distinct (this has been debated, but I set it aside here). This has been repeatedly pointed out in precious work (H. Sigurðsson 1989, 2000, etc.). Icelandic quirky subjects have been widely discussed. See for example Thráinsson (2007), H. Sigurðsson (2012), and the references cited in these works.

Parallel facts are found for (much rarer) genitive subjects: “There would (many farmers.Gen) then (many farmers.Gen) be (?? many farmers.Gen) missed (many farmers.Gen)” (miss = sakna).
on the Subject Float facts.\(^\text{19}\) Floating subjects can show up in a number of positions in the middle field, below Spec/IP, and also in the complement position, regardless of case. If abstract nominative case were the factor that licenses subjects in all these positions, then such case would either have multiple sources within the clause or be able to percolate rather freely down the whole clausal structure, which in turn would mean that abstract nominative case has zero explanatory value with regard to NP-licensing. It would be available in multiple positions, hence unavailable as an explanation or an account of where subjects can be spelled out.

In general, argument licensing in Icelandic is not affected by specific cases (see H. Sigurðsson 1989, 2008, 2012, and the references there). Subject Float does not have any clear A-bar properties either, even though it sometimes relates to focus. It is an intriguing phenomenon.\(^\text{20}\)

3. Low Subject Trapping
Definite subjects are excluded in Subject Float constructions. See (19).

   b. *Pað mundu þá bændurír sennilega verða kosnir í stjórnina.
   c. *Pað mundu þá sennilega bændurír verða kosnir í stjórnina.
   d. *Pað mundu þá sennilega verða bændurír kosnir í stjórnina.
   e. *Pað mundu þá sennilega verða kosnir bændurír í stjórnina.

However, Icelandic displays a number of exceptions from the Indefiniteness Requirement, discussed by Thráinsson (2007:317 ff.; see also Rögnvaldsson 1982 [1990], 1984, H. Sigurðsson 1989, Jónsson 2000, 2005, Vagnsnes 2002, Indriðadóttir 2014, Engdahl et al. 2018). One is that definite subjects quantified by all- ‘all, every’ are well-formed in the high and low I-domain (Vagnsnes 2002, Thráinsson 2007), but ungrammatical within the predicate phrase, as illustrated in (20).\(^\text{21}\)

(20) a. Pað mundu allir bændurír þá sennilega hafa verið kosnir. There would all farmers-the then probably be(come) elected in board-the
   b. ?Pað mundu þá allir bændurír sennilega hafa verið kosnir.
   c. Pað mundu þá sennilega allir bændurír hafa verið kosnir.
   d. *Pað mundu þá sennilega hafa allir bændurír verið kosnir.
   e. *Pað mundu þá sennilega hafa verið kosnir allir bændurír.

The expletive does not seem to be responsible for these patterns. See (21) and the narrative style V1 declaratives in (22).

(21) a. Þá mundu sennilega allir bændurír hafa verið kosnir.
   ‘Then all the farmers would probably have been elected.’
   b. *Þá mundu sennilega hafa verið kosnir allir bændurír.

(22) a. Mundu því sennilega allir bændurír hafa verið kosnir.
   ‘Thus, all the farmers would probably have been elected.’

\(^\text{19}\) Nominative objects and agreement with such objects, as in “Me.DAT would.3PL like these horses.NOM”, ‘I would like these horses’, also pose a problem for the abstract nominative case approach (H. Sigurðsson 1996 and much subsequent work, see Thráinsson 2007:232 ff. and the references there).

\(^\text{20}\) The high subject position and the object position are also available for indefinite subjects in both regular ECM and experiencer ECM in Icelandic. Regular ECM: ‘I believed many farmers.ACC have been elected’, and ‘I believed have been elected many farmers.ACC’. Experiencer ECM: “Me.DAT seemed many farmers.NOM have been elected”, and “Me.DAT seemed have been elected many farmers.NOM”. In contrast, definite subjects are licit in only the high subject position of both types of ECM infinitives (the Definiteness Effect). These facts speak strongly against a case-related approach to argument licensing. I must set this aside here, though, but see H. Sigurðsson (2012).

\(^\text{21}\) Flestir ‘most’ and definite partitives, such as tveir af bændunum.DAT, tveir bændurír.NOM, tveir bændanna.GEN ‘two of the farmers’, behave similarly.
b. *Mundu því sennilega hafa verið kosnir allir bændurnir.

As seen, these all-definates behave partly like plain definates and partly like indefinites. Like plain or bare definites they cannot stay within the predicate phrase, but like indefinites they are licensed in the I-domain.

Another interesting type of exceptions from the Indefiniteness Requirement is illustrated in (23) (see H. Sigurðsson 1989, Jónsson 2000, 2005, Thráinsson 2007, Indriðadóttir 2014). I refer to this construction as Low Subject Trapping, LST, as it has definite NP-subjects that are stuck or trapped within the predicate phrase, an issue I will return to shortly.\(^\text{22}\)

\[(23)\]
\[
a. ~ \text{Það er búin mjólk.} \quad \text{there is finished milk-the} \\
\quad \text{‘There is no more milk (here)’} \\
\quad \text{‘The milk has run out’} \\
\]
\[
b. ~ \text{Það er kaldur ofninn.} \quad \text{there is cold radiating-the} \\
\quad \text{‘The radiator is cold.’} \\
\]
\[
c. ~ \text{Það er brotinn diskurinn.} \quad \text{there is broken plate-the} \\
\quad \text{‘The plate is broken.’} \\
\]
\[
d. ~ \text{Það var bilaður skjárin.} \quad \text{there was broken monitor-the} \\
\quad \text{‘The monitor was out of order.’} \\
\]
\[
e. ~ \text{Það var bráðnaður snjórin.} \quad \text{there was melted snow-the} \\
\quad \text{‘The snow had melted.’} \\
\]

LST is colloquial, and it is marked. In an informant survey (with 710 and 709 informants, respectively), the sentences in (23a) and (23d) were accepted by only 18% and 34%, respectively (and rejected by 64% and 45%, respectively). See Thráinsson et al. (2015:84). LST sentences express some previously unknown event (often unexpected but likely to happen in a given situation), and the subject must be non-topical (i.e., it must not have been spelled out in previous discourse). Thus, in the context “We checked both the stove and the radiator” one could not proceed by saying  \(\text{Það var kaldur ofninn} \) “there was cold oven-the” (one would have to say  \(\text{Ofninn var kaldur} \) in that case). In the present tense, as in (23a), (23b), and (23c), LST sentences often initiate discourse. I could for example go into the kitchen and open the refrigerator to discover that there is no more milk there and then state (23a) to my partner. Alternatively, if my partner were to ask me ‘What is the matter?’ I could naturally answer with (23a) (or, in different situations, with (23b) or (23c)). It is thus difficult to create a natural context for present tense LST in a written informant survey. However, this does not extend to the past tense. The past tense sentences in (23d) and (23e) must be part of a larger discourse, where the background of the previously unknown event has been laid. For the sentence in (24d), the context was  \(\text{Ég komst ekki í tölvuna ‘I could not get into the computer’} \) (Práinsson et al. 2015:78). I will not speculate further on why so many informants in Práinsson et al. (2015) rejected LST sentences. The above-cited Icelandic linguists, who have discussed LST, all agree that many LST sentences are fully natural. The following discussion is based on my own intuitions. As far as I can judge, these intuitions are shared by many other speakers.

LST is constrained in various ways. First, it is incompatible with individual level predicates (i.e., predicates that describe permanent properties of the subject): ??\(\text{Það er stór skjárin} \) “there is big

\(^{22}\) A related but a slightly different type pointed out by Rögnvaldsson (1982 [1990], 1984) is cases like “there shines always blessed sun-the”, “there got-stuck bus-the on its way to the north”, and “there is come guy-the who you met yesterday”. See also H. Sigurðsson (1989:294–295), and Thráinsson (2007:325).

\(^{23}\) I find this less natural for plural subjects: ??\(\text{Það eru kaldir ofnarnir} \) “there are cold the radiators”, ??\(\text{Það voru bilaðir skjárinnir} \) “there were broken monitors-the”. However, if the plural subjects are quantified by all- ‘all, every’, flest- ‘most’, or \(\text{ót} \) ‘both’, this becomes quite natural: \(\text{Það eru kaldir allir/flestir/báðir ofnarnir, Það voru bilaðir allir/flestir/báðir skjárinnir} \). Perhaps, increased heaviess or focus is a contributing factor here.
monitor-the”, etc. (Jónsson 2005:457). Second, the subject cannot easily be animate, even with stage level predicates (describing non-permanent properties). See (24).

(24) a. *Það er veikur kennarinn.
   there is sick teacher-the
b. *Það er fótbrotinn hesturinn.
   there is leg-broken horse-the
c. *Það er reiður strákurinn.
   there is angry boy-the

Third, the construction commonly requires clause-initial það in declaratives, as opposed to questions. See (25). In certain contexts, however, this requirement is lifted, see (25c).

(25) a. ?? Nú er búin mjólk.
   now is finished milk-the
(OK: Nú er mjólkinn búin)
b. ?? Þá var bilaður skjárinn.
   then was broken monitor-the
(OK: Þá var skjárinn bilaður)
c. Ég ætlaði að nota töluna en þá var bilaður skjárinn.
   I intended to use computer-the but then was broken monitor-the
   ‘I intended to use the computer, but then the monitor was out of order.’
d. Er búin mjólk?
   is finished milk-the
   ‘Is there no more milk here?’
e. Var bilaður skjárinn?
   was broken monitor-the
   ‘Was the monitor out of order?’

Fourth, LST is mainly found in the simple tenses, present and past. As we will see, it is sometimes grammatical in complex tenses (present and past perfects, etc.), but often it is less natural than in the simple tenses. See (26).

(26) a. *Það hefur sennilega verið búin mjólk.
   there has probably been finished milk-the
b. ?? Það hafði sennilega verið bilaður skjárinn.
   there had probably been broken monitor-the

Fifth, the subject must be a definite full NP. It cannot be an indefinite NP, nor can it be a pronoun. See (27).

(27) a. *Það er búin mjólk/hún.
   there is finished milk/she (= ‘it’)
b. *Það er kaldur ofn/hann.25
   there is cold (a) radiator/he (= ‘it’)

Sixth, and most symptomatically, the subject is trapped within the predicate phrase; it cannot raise or float into the middle field. See (28) and (29).

(28) a. *Það er mjólkinn búin.
   there is milk-the finished

---

24 However, I find ?Sjáðu, það er grár kötturinn “Look, there is gray cat-the” much better than *Sjáðu, það er grár maðurinn “Look, there is gray man-the”, even though it seems natural to interpret grár ‘gray’ here as an individual level predicate rather than as a stage level predicate.

25 The indefinite NP is grammatical in a presentational sentence with a stage setting adverbial (cf. Milsark 1977): Það er kaldur ofn í húsinu “there is (a) cold radiator in house-the”.
Inasmuch as verbal LST is compatible with the complex tenses, it can be shown that the subject must not raise into the I-domain. See (31).

(31) a. Ḥað klárast mjólk (ef þú drekkur hana alla). there gets-finished milk-the (if you drink it all) ‘The milk will run out (if you drink it all).’

b. Ḥað slokknar ljós (ef þú gerir þetta). there goes-out light-the (if you do this) ‘The light will go out (if you do this).’

c. Ḥað kólnaði ofninn. there cooled radiator-the ‘The radiator got cold(er).’

d. Ḥað bilaði skjárin. there broke monitor-the ‘The monitor went out of order.’

e. Ḥað bráðnaði ísinn. there melted ice-the ‘The ice/ice-cream melted.’

f. Ḥað brotnaði diskurinn. there broke plate-the ‘The plate broke.’

g. Ḥað rifnaði pokinn. there tore bag-the ‘The bag burst.’

g. Ḥað lagaði veðrið. there got-better weather-the ‘The weather got better.’

Unintentional causers in Icelandic are commonly expressed in hjá- ‘by/at’ phrases (Wood 2013; the preposition hjá takes a dative complement). Hjá-phrases can also denote a possessor (E. Sigurðsson 2006, Práínsson et al. 2015) or a location. If such a phrase is added to (31a), the clause gains in acceptability (and so do clauses with other complex tenses). As shown in (32), the subject can either follow or precede the hjá-phrase.

26 In some cases of this sort (as in, e.g., “there broke plate-the”) there is an innocence indication: “I am not responsible, it just happened/happens”, but the same applies to “the plate broke”.

27 For example, clauses with future mun ‘will’ and the complex future koma til með að ‘will’, lit. “come to with to”. See (i) for the latter.
(32) a. Það hefur sennilega bilað hjá henni **skjárinn**.
   there has probably broken by her.DAT monitor-the
   ‘The monitor has probably broken down on her.’
   ‘Her monitor has probably broken down.’
   ‘She has probably unintentionally caused the/her monitor to break down.’

   b. Það hefur sennilega bilað **skjárinn** hjá henni,
   ‘The monitor has probably broken down on her.’
   ‘Her monitor has probably broken down.’
   ‘She has probably unintentionally caused the/her monitor to break down.’

The order in (32b) is slightly more marked than the one in (32a), but both are grammatical.

This pattern is found for simple tense verbal and adjectival LST as well, as illustrated in (33) and (34).

(33) a. Það kolnaði hjá mér **ofninn**.
   there cooled by me.DAT radiator-the
   ‘The radiator at my place got cold(er).’
   ‘The radiator got cold(er) on me.’
   ‘My radiator got cold(er).’

   b. Það kolnaði **ofninn** hjá mér.
   *(32b)*

(34) a. Það er kaldur hjá mér **ofninn**.
   there is cold by me.DAT radiator-the
   ‘The radiator at my place is cold.’
   ‘The radiator is (being) cold on me.’
   ‘My radiator is cold.’

   b. Það er kaldur **ofninn** hjá mér.
   *(32b)*

The *b*-examples in (32)–(34) might involve raising of the subject within the predicate phrase. Alternatively, the *a*-examples might involve raising of the *hjá*-phrase, or there might be two distinct base structures. I will not try to sort this out here (but see Wood 2013 for a discussion of the syntax of clauses with *hjá*-phrases). In any case, neither the subject nor the *hjá*-phrase can move into the I-domain. See (35) and (36).

(35) a. Það hefur sennilega bilað **skjárinn** hjá henni. = (32b)

   b. *Það hefur sennilega **skjárinn** bilað hjá henni.
   c. *Það hefur **skjárinn** sennilega bilað hjá henni.

(36) a. Það hefur sennilega bilað **hjá henni** **skjárinn**.
   there is cold by me.DAT radiator-the
   ‘The radiator at your place will get cold(er).’
   ‘The radiator will get cold(er) on you.’
   ‘Your radiator will get cold(er).’

   b. *Það hefur **hjá henni** sennilega bilað **skjárinn**.
   *(32a)*

The *hjá*-phrases have a special status. Other PPs cannot normally precede the subject in LST, see (37) and (38).

(37) a. Það kolnaði **ofninn** í **stofunni**.
   there cooled radiator-the in living.room-the
   ‘The radiator in the living room got cold(er).’

   b. *Það kolnaði í **stofunni** **ofninn**.

(i) a. Það kemur til með að kólna hjá þér **ofninn**.
   there comes to with to cool by you.DAT radiator-the
   ‘The radiator at your place will get cold(er).’
   ‘The radiator will get cold(er) on you.’
   ‘Your radiator will get cold(er).’

   b. *Það kemur til með að kólna **ofninn** hjá þér.
(38) a. Það kólndaði ofninn í morgun.
   there cooled radiator-the in morning
   ‘The radiator got cold(er) this morning.’

   b. *Það kólndaði í morgun ofninn.

All the LST examples we have looked at so far have nominative subjects, but there are also cases of verbal LST with quirky subjects.\(^{28}\) See (39).

(39) a. Það seinkar fluginu.
   there delays flight-the.DAT
   ‘The flight will be late.’

   b. Það verður flýtt klukkunni á morgun.
   there will.be speeded clock-the.DAT on morrow
   ‘The clock will be speeded up tomorrow.’

   c. Það fækkar alltaf ferðunum.
   there get.fewer always trips-the.DAT
   ‘The trips are getting fewer all the time.’

Finally, both nominative and quirky subjects are possible in some LST “nonraising raising infinitives”, as in (40).\(^{29}\)

(40) a. Það virðist vera kaldur ofninn.
   there seems be cold radiator-the.NOM
   ‘The radiator seems to be cold.’

   b. Það virðist hafa seinkað fluginu.
   there seems have delayed flight-the.DAT
   ‘The flight seems to be/have been late.’

This (almost) completes my description of LST. It is the most detailed description of the phenomenon to date. The obligatory trapping of the definite subject within the predicate phrase is particularly intriguing. It might be related to two other phenomena, the (non-standard) \textit{New Passive} and the \textit{Ergative-Impersonal Alternation}.\(^{30}\) In both these phenomena, definite NPs that are potential subject candidates must stay within the predicate phrase. Consider the New Passive first (see E. Sigurðsson 2017:208 ff. and the references there, including Maling & Sigurjónsdóttir 2002). It is illustrated in (41b) and (41c), in comparison with the standard or traditional passive in (41a); as shown in (41d) and (41e), the accusative NP cannot raise into the I-domain. DFT = a default, nonagreeing N.SG form.\(^{31}\)

(41) a. Kennarinn var rekinn.
   teacher-the.NOM was fired.NOM.M.SG
   ‘The teacher was fired.’

   b. Það var rekið kennaranum.
   there was invited teacher-the.DAT
   ‘The teacher was invited.’
   ‘Somebody/They fired the teacher.’

\(^{28}\) Quirky subjects of predicative adjectives (as in \textit{Mér er kalt} “me is cold”, ‘I am cold’) are confined to animate experiencers. As the subject in LST cannot easily be animate, there are no cases of adjectival LST with quirky subjects.

\(^{29}\) This is excluded in PRO infinitives but only marginally degraded in passive Það-initial ECM constructions: *Það var talinn vera kaldur ofninn í stofunni “there was believed be cold radiator-the.NOM in living.room-the’.

\(^{30}\) Yet another phenomenon that might be related to LST is the so-called Impersonal Modal Construction, as in \textit{Nú/Það verður að banna þessa hegðun.} \textit{ACC} “Now/There must to forbid this behavior” ‘This behavior must be forbidden (now)’ (see H. Sigurðsson 1989, Wood 2017).

\(^{31}\) Parallel patterns are found for datives: Það var boðið kennaranum “there was invited teacher-the.DAT’ vs. *Það var kennaranum boðið “there was teacher-the.DAT invited”, etc.
c. Var rekið kennarann?
d. *
Pað var kennarann rekið.
e. *
Var kennarann rekið?

The Ergative-Impersonal Alternation is illustrated in (42) (for further discussion see H. Sigurðsson 1989:236–237, 289–292). The ergative version in (42a) has regular NP-movement to subject, whereas the impersonal version in (42b) and (42c) has the NP embedded in a preposition phrase; as shown in (42d) and (42e), the preposition NP complement cannot raise into the I-domain.

(42) a. Kertið slokknaði.
candle-the.NOM went.out
‘The candle went out.’
b. Pað slokknaði á kertinu.
there went.out on candle-the.DAT
‘The candle went out.’
c. Slokknaði á kertinu?
d. *
Pað slokknaði kertinu á.
e. *
Slokknaði kertinu á?

In both the New Passive and the impersonal PP clauses, though, the low NP is assigned case within the predicate phrase, so its inability to raise into the I-domain might be taken to be an instantiation of (criterial) freezing in the sense of Chomsky (2001:6) or Rizzi (e.g., 2007), saying roughly that an NP that has checked all its features (case, etc.) gets frozen in place and cannot move any further (a reasonable conjecture). The trapping of the subject in LST relates to information structure; as we have seen the trapped subject must not be topical. Its position might be a criterial focus position, for a non-topical but a situation-given subject, but it is difficult to find any evidence bearing on the issue, apart from the trapping itself. Alternatively, or in addition, the subject cannot raise out of the predicate phrase as it does not match a Topic feature or Topic features high in the clausal structure. In any event, the subject is commonly nominative in LST, so, on widely adopted approaches to NP-movement (e.g., Chomsky 1981), it “should” move into the I-domain to get its case checked in (a) local relation to Infl. We must conclude that LST is unrelated to specific cases – something different from case is responsible for the trapping. In addition, as we saw in section 2, Subject Float is unrelated to case. In Subject Float, the indefinite subject may raise out of the predicate phrase into the I-domain, but the float applies to subject NPs regardless of their case marking.

A very sharp difference between the New Passive and the impersonal PP clauses on one hand and LST on the other hand is that the predicate phrase internal argument can easily be a pronoun in the former but not in the latter. See the contrasts between (43) and (44).

(43) a. Pað var rekið hana.
there was fired her
‘She was fired.’
‘Somebody/They fired her.’
b. Pað slokknaði á því.
there went-out on it
‘It went out.’

(44) a. *Pað er kaldur hann.
there is cold he (= ‘it’)

b. *Pað kólnaði hann.
there cooled he (= ‘it’)

This sharp difference has gone unnoticed hitherto, for example in my own works. In Sigurðsson (2010), I treated definite NPs on a par with pronouns. Although treating pronouns and definite full NPs alike might be sufficient for English it is evidently not accurate for Icelandic. A possible line of reasoning here is that pronouns in non-transitive constructions differ from full NPs in that they must normally be
in the vicinity of Person checking features in the C-/I-domain, an effect that has commonly, and misleadingly, been attributed to case or to the Extended Projection Principle. There are, however, exceptions from this, where the NP is “shielded” from high Person checking by an intervening element, including passive morphology in the New Passive and prepositions (in Icelandic, as opposed to for example English, which has pseudo passives, absent from Icelandic). These intervening elements seem to be heading strong phases, thus having their own Person checking features, thereby blocking matching of Person checking features in the C-/I-domain by regular minimality (see the discussion in H. Sigurðsson 2010, 2011, 2012, Legate 2014, E. Sigurðsson 2017).

NP raising to Spec,IP arguably involves matching of Person checking features in the C-/I-domain. In addition, the Subject Float and LST facts discussed here suggest that it also involves matching of a Topic feature or Topic features high in clausal structure.

4. Concluding remarks
In this article I have described and discussed two sets of perplexing and poorly understood (in)definiteness facts in Icelandic, Low Subject Trapping, applying to some definite subjects, and Subject Float, applying to indefinite subjects in presentational (and related) constructions. The facts described here show that some definite subjects must be spelled out in the complement position within the predicate phrase and that quantified indefinite subjects can be spelled out in a number of positions in the middle field, above the predicate (in addition to the complement position). The licensing of subject NPs in the various positions is unrelated to specific cases, thus speaking loud and clearly against the assumption (Vergnaud’s conjecture) in Chomsky (1981) and much subsequent writings that case plays an essential role in NP-licensing. Case marking and case agreement in Icelandic infinitives also demonstrate very clearly that the assumption is unfounded (see H. Sigurðsson 2008, 2012, and the references there). It is difficult to test this assumption in languages such as English, with barely any case marking, but it can be tested in Icelandic, and the results are unequivocal: Case does not account for argument licensing.

In all fairness, it must be added that Chomsky has abandoned his original “case story”, albeit only reluctantly in passing (“Case assignment is divorced from movement”, 2001:17). However, the field has not followed in his footsteps (see, e.g., Lasnik 2008, Legate 2008). A much weaker approach, in the spirit of Sapir (1921), might be upheld, namely, that cased NPs are partly licensed by having some case, regardless of which, but that is a vague statement, with limited predictive power. Nominative case, abstract or not, is unrelated to subject licensing in Spec,IP, which instead seems to boil down to Person and Topic matching.

If linguistics were like the natural sciences, Vergnaud’s conjecture would have been generally discarded a long time ago, and the whole field would be looking for alternative accounts of NP-licensing. Unfortunately, that is not the case, but hopefully it will be.
