Differential Object Marking: Nominal and Verbal Parameters
Keith Tse

Abstract. Rich comparative-typological work has established Differential Object Marking (DOM) as a linguistic universal based on various dimensions of nominal and verbal markedness where more marked categories are more likely to be morphologically marked than unmarked ones (Aissen 2003). However, despite the seemingly uniform and homogeneous properties in the world’s examples, the great variety and diversity of lexical sources raise the possibility of there being microvariations between different types of DOM. Romance preposition ad and Chinese co-verb ba are two mainstream examples of DOM and a comparison shows that different lexical sources can give rise to nominally-driven and verbally-driven mechanisms of DOM, since while Romance ad is reanalysed as a nominal Case-marker and is extended to all relevant types of object nouns (animate/referential), Chinese ba is embedded in the verbal domain where it selects transitive/affective types of verb phrases. This comparison opens up new perspectives on the mechanisms of DOM, namely the clustering of nominal and verbal markedness which can be shown to correlate with the lexical sources of the DOM-markers.

Keywords. Latin, Romance, Chinese, Case theory, Differential Argument Marking, Different Object Marking, syntax

1. Introduction. Differential Object Marking (DOM) is a cross-linguistically pervasive phenomenon where certain marked categories of the same grammatical relation (here object) are morphologically distinguished from unmarked ones, as defined in Serzant & Witzlack-Makarevich (S&W) (2019:17): “Any kind of situation where an argument of a predicate bearing the same semantic argument role may be coded in different ways, depending on factors other than the argument role itself and/or the clausal properties of the predicate such as polarity, TAM, embeddedness etc”. Extensive typological work has revealed a number of nominal and verbal dimensions of markedness which seem to underlie and trigger DOM, and these consist of numerous factors of transitivity which are summarised by Hopper & Thompson (H&T) (1980):

* This paper is an amalgam of the author’s work on Romance and Chinese philology which is indebted to numerous groups of people. I would like to acknowledge the audiences for their professional, expert and constructive feedback at North American Conference in Chinese Linguistics 2013 (University of Michigan), Going Romance 2013 (University of Amsterdam), Diachrony of Differential Object Marking 2017 (Institut Nationale des Langues et Civilisations Orientales, Paris), Ohio State University Congress in Hispanic and Lusophone Linguistics 2018, Linguistic Symposium on Romance Languages 2018 (York University, Toronto), Microvariations in Romance Differential Object Marking 2018 (Institut Nationale des Langues et Civilisations Orientales, Paris) and Third International Workshop on Syntactic Cartography 2019 (Beijing Language and Culture University). I must also acknowledge the Ronin Institute and the Philological Society of Great Britain for their generous funding which allowed me to present my research abroad. Moreover, I would like to express my heartfelt thanks to Professor Edith Aldrige for advising me to compare Romance and Chinese Differential Object Marking in December 2017 and to the syntax-semantics research group at the University of York (UK) to whom an earlier version of this paper was presented in May 2018. This paper is a reworked version of my previous work which would not be in the form that it is without all the help and assistance that I received from the people mentioned above to whom I owe immense gratitude. Authors: Keith Tse, Ronin Institute/Institute of Globally Distributed Open Research and Education (keith.tse@balliol-oxford.com).
Table 1. Transitivity (H&T 1980:252)

In classic analyses of verbal and event semantics (*aktionsart*) (Vendler 1967, Dowty 1991), transitive verbs such as Achievements and Accomplishments, in contrast to States (BE) and Activities (DO), are distinguished in effecting change (BECOME) in their objects (Rappaport Hovav & Levin 2005, Ramchand 2008), which further entails distinctive properties such as affectedness/kinesis, telicity/punctuality, and agentivity/volitionality (Tenny 1994). Moreover, the individuation of object has also been described in various ways, which are also summed up by H&T (1980:252):

<table>
<thead>
<tr>
<th>Individuated</th>
<th>Non-individuated</th>
</tr>
</thead>
<tbody>
<tr>
<td>Proper</td>
<td>Common</td>
</tr>
<tr>
<td>Human, animate</td>
<td>Inanimate</td>

</tr>
<tr>
<td>Count</td>
<td>Mass</td>
</tr>
<tr>
<td>Referential, definite</td>
<td>Non-referential</td>
</tr>
</tbody>
</table>

Table 2. Individuation of O (H&T 1980:252)

(Silverstein 1976:169), all of which may be summed up in the following scale (Dixon 1979:85, Lazard 1984:283):

(1) 1<sup>st</sup> Person Pronoun > 2<sup>nd</sup> Person Pronoun > 3<sup>rd</sup> Person Pronoun > Proper Nouns > Human Common Nouns > Animate Common Nouns > Inanimate Common Noun

Despite significant degrees of similarity and coherence between cases of DOM across numerous languages which suggests universal principles at work (Tsunoda 1985, Bossong 1991, S&W 2019), the relationship between the various parameters of DOM is as yet controversial, since there is <i>a priori</i> no necessary correlation between these nominal and verbal dimensions, which raises the possibility of there being different types of DOM based on different types of nominal and verbal parameters. In line with the typological range of DOM-markers, this paper considers and compares two famous examples; Romance preposition <i>ad</i> and Chinese co-verb <i>ba</i>, as these represent two distinct lexical sources (lexical preposition and lexical verb respectively) which seem to share similar DOM-effects in their respective languages, namely the marking of animate and/or referential objects and the selection of transitive/affective types of verbs (see Nocentini 1985 and Li 2006 for summaries on Romance <i>ad</i> and Chinese <i>ba</i> respectively). However, a closer comparison of their distribution shows that Romance <i>ad</i> has been generalised in certain varieties to all animate and/or referential objects at the expense of affectedness (Heusinger 2008) while Chinese <i>ba</i> obligatorily selects strongly transitive/affective types of verbs which may select indefinite and non-specific objects as long as they are delimited (Ritter & Rosen 2000). These discrepancies can be correlated with their diachronic formation, since Romance <i>ad</i> is widely analysed as a nominal Case-marker which has hence been generalised to all relevant marked object nouns whereas Chinese <i>ba</i> is formally analysed as a Light Verb which has selectional restrictions on its verbal complement. This comparison suggests that the nominal and verbal parameters of DOM can be applied to the historical-comparative dimension where different lexical sources (here preposition and verb) can give rise to different types of DOM in line with principles of A(rgument)-selection and subcategorization, which, in the cases of Romance <i>ad</i> and Chinese <i>ba</i>, create DOM-systems which are more nominally and verbally driven respectively.

The main body of this paper is divided into three sections: Section 2 summarises the formal and empirical properties of Romance <i>ad</i> used in Western Romance DOM<sup>1</sup> which can be shown to be derived from Latin allative preposition <i>ad</i> ‘to/towards’ whose original lexical semantics, Case-assignment and selectional restrictions entail that <i>ad</i> selects designated thematic roles (“recipient”/”beneficiary”/”experiencer”) as well as referential objects (“destination”/”direction”), and these selectional properties seem to anticipate Romance DOM (Sornicola 1997, 1998, Fagard & Mardale 2017), namely the use of <i>ad</i> for marking animate, referential and affected objects in numerous varieties. Section 3 considers the formation of Chinese <i>ba</i> from Medieval Chinese serial verb constructions which are reanalysed as monoclusal in restructuring contexts when the verb of the second verb phrase is strongly transitive/affective and it selects an object pronoun which is coreferential with the object of <i>ba</i> (Peyraube 1985, 1989, Feng 2002b) and this extends to Modern Mandarin Chinese where <i>ba</i> selects delimited objects in line with the telicity of the transitive/affective lexical verb (Ritter & Rosen 2000). Based on the comparative data, Section 3 proposes two types of DOM which involve two different mechanisms of parametric clustering, namely nominal DOM as exemplified by Romance <i>ad</i> where nominal markedness in

---

<sup>1</sup> A similar though etymologically unrelated morpheme <i>pe</i> is attested as a DOM-marker in Romanian (Mardale 2002) and will not be treated in this paper.
animacy and referentiality forms the core of Romance DOM and affectedness secondarily extends to verbal transitivity, and verbal DOM in Chinese *ba* where verbal transitivity in the verbal complement of *ba* is primary and this entails not necessarily definiteness or specificity but delimitedness in the object noun.

2. **Latin/Romance ad (P(reposition) > K(ase))**. The use of Romance preposition *ad* as a marker of DOM is widely attested in Western Romance with dialectal microvariations (Rolhfs 1971, Roegiest 1979, Nocentini 1992, Zamboni 1993, see footnote 1), and *ad* is commonly analysed as a Case-marker (K) of object nouns whose lexical semantic and discourse-pragmatic properties form minimal pairs with their unmarked counterparts (Brugè & Brugger 1994, Guardiano 2010, López 2012). The key notions in question here are the animacy of the object noun, which may be canonically human (2a), inclusive of non-humans (e.g. animals) (2b) or exclusive of a particular type of human (e.g. divinity) (2c), referentiality of the object noun, which can be subdivided into definiteness (3a), specificity (3b), singularity/individuality (3c), proper (3d) and pronominal (3e), and affected objects selected by strongly transitive/affective types of verbs (4):

(2)  

a. Spanish (Kliffer 1995:93)  

ve-o a la muchacha  

see-PRES.1SG AD ART girl  

‘I see the girl’

b. Spanish (Pensado 1995:19-20)  

v-i a un perro

‘He saw me.’

(4) Spanish (García García 2007:68)
el entusiasmo venc-e a la dificultad
The enthusiasm conquer-PRES.3SG AD the difficulty
‘Enthusiasm conquers difficulty.’

The comparative distribution of Romance DOM is such that ad is predominantly a nominal marker, since while in most varieties ad can be found as a marker of personal pronouns and proper nouns as seen in Portuguese (5a-b) and Catalán (5c-d), ad is generalised to all human/animal common nouns which may be (optionally) marked even if indefinite or non-specific in Spanish (6a-b), and in Italian dialects (7a-c) referential inanimates may also be marked too

(5) a. Portuguese (Schwenter 2014:238)
od-eia a mim
hate-PRES.3SG AD me
‘He hates me.’

b. European Portuguese (Roegiest 1979:38)
vej-o (a) João
see-PRES.1SG AD João
‘I see João.’

c. Catalán (Escandell-Vidal 2007:188)
jo t’ ajudo a tu

i tu m’ ajudar-à-s a mi
and you me help-FUT-2SG AD me
‘I help you and you will help me.’

d. Catalán (Escandell-Vidal 2009:840)
veu-r-é a la Maria
see-FUT-1SG AD ART Maria
‘I shall see Maria.’

(6) a. Spanish (Kliffer 1995:100)
encontr-é (a) unos hombres
find-PRET.1SG AD some men
‘I found some men.’

b. Spanish (Leonetti 2004:80)
necesit-a (a) una enfermera
need-PRES.3SG AD a nurse
que pas-e la mañana con ella
who spend-PRES.SUBJ.3SG ART morning with her
‘She needs (an) nurse to spend the morning with her.’

(7) a. Sardinian (Floricic 2003:253)
app-o vis-tu a custu/cussu
have-PRES.1SG see-PERF.PTCP AD this/that
‘I saw this/that.’
b. Gorgoglione, in Basilicata (Manzini & Savoia 2005:508)
  miette a kkweiste
  put.IMPERATIVE.2SG AD this
  ‘Put this one.’

c. Colobraro, in Basilicata (Manzini & Savoia 2005:509)
  te dewe (a) kkwiste
  you owe.PRES.1SG AD this
  ‘I owe you this.’

Affectedness, in comparison, is secondary, since only in Spanish can DOM-effect of affectedness be discerned where ad is used for marking inanimate and non-personified objects of highly transitive/affective verbs:

(8)  a. Spanish (Molho 1958:214)
  los acidos atac-a-n a los metales
  ART acids attack-PRES-3PL AD ART metals
  ‘Acids attack metals.’

b. Spanish (Laca 1995:67)
  la primavera preced-e a-l verano

  ‘Spring precedes winter.’

c. Spanish (Laca 1995:69)
  las dificultades priv-a-n a-l proyecto
  ART difficulties deprive-PRES-3PL AD-ART project
de todo su atractivo inicial
  of all its attractiveness initial
  ‘Difficulties deprive the project of all its initial attractiveness.’

d. Spanish (Torrego 1999:1801)
  el adjetivo modific-a a-l sustantivo
  ART adjective modify-PRES.3SG AD-ART noun
  ‘The adjective modifies the noun.’

e. Spanish (Fabregas 2013:15)
  su voluntad obedec-e a la razón
  his will obey-PRES.3SG AD ART reason
  ‘His will obeys his reason.’

The DOM-properties of Romance ad (K), therefore, may be represented thus where it is either selected by the various functional layers of the object noun phrase (DP) or by a unique functional head denoting affectedness (Affect) whose specifier holds the object argument marked by ad (cf Torrego 1998, Mordoñedo 2007):
In the diachronic formation and evolution of Romance DOM, the wide geographical and historical distribution of *ad* strongly suggests that it is formed in proto-Romance (Sornicola 1998), and it is indeed attested that Latin allative/directional preposition *ad* may be dependent on certain two/three-place lexical verbs where its argument may be reanalysed as direct/indirect objects of the verbs (Sornicola 1997, Adams 2013, Adams & de Melo 2016). However, despite the functional parity between the argument of *ad* and the object relation(s) of the lexical verbs, detailed philological analysis shows that Latin *ad* retains its lexical semantic properties in denoting certain thematic roles (Adams 2013:278ff), namely “direction”/”destination” and “recipient”/”beneficiary”, which is attested from as early as Plautus (2nd century BC) (10a) and throughout the history of Latin (Classical (10b)/Christian (10c)/Medieval (10d)) with verbs of vision (*verba videndi*) which consistently select definite and specific objects in the extended sense of ‘visiting’ (10a-b, d) and ‘rotating’ (10c, e-g):

(10) a. nunc ad era-m revide-b-o
    now AD mistress-ACC revisit-FUT-1SG
    ‘I shall see her again (at hers) now.’ (Plautus *Truculentus* 320)

2 In line with Postal (1969), personal pronouns are here analysed as bare D-elements which lexicalise general phi-features which may be decomposed into grammatical person and number attributes and values.
Furthermore, in the Christian and Medieval eras ad is also found with two/three-place verbs which assign ethic dative to their direct/indirect objects (“recipient”/“beneficiary”) and these turn out to be marked by ad in Romance (Sornicola 1997, 1998) e.g. verbs of serving servire ‘to serve’ (11a-b) which select animate direct objects in the thematic role of ‘beneficiary’ (Blake and Velázquez-Mendoza 2012), and verbs of shouting and begging/praying (verba clamandi et rogandi) (11c-e) which also select human/animate objects marked by ad and these come into contrast with unmarked inanimate objects in the direct object relation (Huertas 2009):

(11) a. ad cuius imperium caelum terra maria servie-ba-nt  
    AD whose command heaven earth seas serve-IMPERF-3PL  
    ‘whose power heaven, earth and the seas served.’ (Jerome Epistulae 82.3)

b. ibi deb-e-nt servi-re a sancta Maria  
    there must-PRES-3PL serve-INF AD holy Mary  
    ‘There they must serve Holy Mary.’ (Sahagún 423)
c. de profund-is clama-v-i ad te, Domin-e from depth-ABL.PL shout-PERF.1SG AD you Lord-VOC
‘From the depths of my heart I shouted (something) at you, my Lord’ >
‘… I called you, my Lord.’ (Biblia Sacra, Psalms 129)
d. Moyses ora-ba-t ad Dominum Moses pray-IMPERF.3SG AD Lord
‘Moses was praying to the Lord.’ (Libri Maccabaeorum 2.10)
e. veniam… ad Domino posoce-ba-t mercy AD Lord demand-IMPERF.3SG
‘She was praying the Lord formerly.’ (Chronicon Salernitanum 11)

As Latin dative is thematically conditioned in being assigned to certain thematic roles (“recipient”/“beneficiary”) which are necessarily human/animate and even divine in the case of verbs of begging/praying (ad Dominum (11d), ad Domino (11e)), ad comes to be associated with human/animate/divine objects which may also be affected. In the formation of Romance DOM, therefore, ad is reanalysed as a nominal marker of DOM which connects it with various marked nominal categories, and although affectedness is evident in the use of ad with verbs that assign ethic dative (11a-e), this is a secondary factor in Romance where nominal markedness seems to be the main criterion. The next section examines the formation and distribution of Chinese DOM in ba-constructions which display similar yet different properties.

3. Chinese ba (Verb) > Voice. Chinese ba-constructions consist of a preposed object which comes right after ba but is thematically related to the main lexical verb (Li 2006), and various constituency tests show that ba heads a unique functional projection which does not form phrasal constituents with the preposed object, since the object seems to form constituents with the lexical verb phrase:

(12) 他 把 門 洗好 (和) 窗戶 洗乾淨了
He BA door wash-finish and window wipe-clean-ASP
‘He washed the door and wiped the window clean.’ (Li 2006:382)

Furthermore, in contrast to Romance ad (see previous section), Chinese ba obligatorily selects transitive/affective verb phrases which must not be bare and must denote verbal and prosodic properties such as aspect (13a), object complement (13b), affectedness (13c), adverbial modification (13d) and disyllabicity (13e):

(13) a. 他 把 那個 房子 蓋*了)
He BA that-CL house build-ASP
‘He built that house.’ (Liu 1997:63)

b. 我們 把 李四 責*了)/*(一頓)/*(得 很 厲害)
we BA Lisi ma-le yidun de hen lihai
‘We scolded Lisi once very serious.’ (Li 2006:395)
Moreover, although it has been argued that the preposed object must be referential and known which seems to suggest A’s movement of the object to an internal Topic/Focus projection (Tsao 1986, Bender 2000, Arcodia & Iemmolo 2014), indefinite objects headed by indefinite articles (yi)ge ‘a/one’ (14a-b) as well as non-specific generic objects (14c) are attested in ba-constructions which are not referential but delimited by the telic nature of the lexical verb phrase (Wang 1985, Liu 1997, Ritter & Rosen 2000). Furthermore, ba-constructions may optionally contain an unaccusative marker gei (給) right above the lower VP (14d) (Tang 2001), which supports the hypothesis that the preposed object is merged in the specifier of a functional head denoting affectedness (Kuo 2010):

(14)  
a.  他  把  一個  機會  錯過-了  
  ta  ba  yi-ge  jihui  cuoguo-le  
  ‘He missed an opportunity.’ (Liu 1997:94)  
b.  小張  把  個  孩子  生  
  xiaozhang  ba  ge  haizi  sheng  
  ‘Xiaozhang gave birth to a child on the train.’ (Wang 1985:51)  
c.  他們  正好  可以  把  自學  與  家傳  
  tamen  zhenghao  keyi  ba  zixue  yu  jiachuan  
  ‘They indeed can mutually combine what they taught themselves and what they learnt from their families.’ (Wang 1985:51)  
d.  弟弟  把  杯子  給  打-碎-了  
  didi  ba  beizi  (gei)  da-sui-le  
  ‘Younger brother broke the cup.’ (Tang 2001:283)
ba is hence commonly represented as a functional head (Voice) above Asp(ect) while the lexical verb undergoes head movement in order to obtain aspectual suffixes and various theta-assigning A-heads (Zou 1995:78ff, Li 2006:408-412), and in between there should be posited a functional projection denoting affectedness (Affect) which may be optionally lexicalised by gei whose specifier holds the preposed object, as shown below:

\[
\begin{array}{c}
\text{VoiceP} \\
\text{SpecVoice} \quad \text{Voice'} \\
\text{didi} \\
\text{Voice} \quad \text{AffectP} \\
\text{ba} \\
\text{SpecAffect} \quad \text{Affect'} \\
\text{beizi} \\
\text{Affect} \quad \text{AspectP} \\
\text{(gei)} \\
\text{SpecAspect} \quad \text{Aspect'} \\
\text{Aspect \_ \_ \_ \_ \_ \_ \_ \_ \_} \\
\text{Specv} \quad \text{vP} \\
\text{v} \\
\text{VP} \\
\text{t_i} \\
\text{V} \\
\text{t_i}
\end{array}
\]

Chinese co-verbs are derived from serial constructions (Peyraube 1996, Rhys 2000), and in the case of ba which is originally a lexical verb meaning ‘to take/hold’ (Bennett 1981) it is widely argued that ba is reanalysed in restructuring contexts where the serial verb construction is reanalysable as monoclausal due to the fact that there is coreference between the object of ba (and the etymologically related jiang (将)) and the object of the second verb phrase, the latter of which may be resumed by a resumptive pronoun (Peyraube and Chappell 2011) which still exists in Chinese dialects (20c):

\[
\begin{array}{c}
\text{wu} \quad \text{ba} \quad \text{gaohuang} \quad \text{yong} \quad \text{ren} \quad \text{ci} \quad \text{zhi} \\
\text{Wu} \quad \text{BA} \quad \text{emperor} \quad \text{use} \quad \text{blade} \quad \text{stab} \quad \text{him} \\
\text{‘Wu stabbed the emperor with a blade.’} \quad \text{(前漢書平話, 卷上)}
\end{array}
\]

\[
\begin{array}{c}
\text{ru} \quad \text{jiang} \quad \text{ci} \quad \text{ren} \quad \text{anxu} \quad \text{sha} \quad \text{zhi} \\
\text{you} \quad \text{JIANG} \quad \text{this} \quad \text{man} \quad \text{carefully} \quad \text{kill} \quad \text{him} \\
\text{wu} \quad \text{sun} \quad \text{pi} \quad \text{rou} \\
\text{NEG} \quad \text{damage} \quad \text{skin} \quad \text{flesh} \\
\text{‘You kill this man carefully without damaging his skin or flesh.’} \quad \text{(佛説長阿含經)}
\end{array}
\]
c. 千祈唔好將啲頭髮染-黑恆

chinkei nghou jeung di taufaat yim-hak keui
please NEG JIANG CL hair dye-black it

‘Please do not dye the hair black.’ (Cantonese, in Chappell 2007:188)

In the reanalysis of the object of ba as the object of the second verb, the second verb must be strongly transitive in order to select the object of ba as its own preposed object merged in a higher A-position (gaohuang.. ci zhi ‘stab the emperor’ (16a), ci ren... sha zhe ‘kill this man’ (16b), di taufaat... yim-hak keui ‘dye the hair black’ (16c)), which not only eliminates the original argument structure of ba as a lexical verb and leads to its reanalysis as a functional head but also entails verb movement in the second verb phrase which hence shows verbal properties such as aspect and object complementation (13a-e). Futhermore, as transitive/affective verbs are telic and hence select delimited objects, the preposed object in ba-constructions is delimited which does not necessarily imply definiteness or specificity (14a-c). Chinese ba, therefore, is essentially a verbally-driven DOM construction which entails nominal properties. These mechanisms of DOM in Chinese and Romance are summarized in the next concluding section.

4. Differential Object Marking: Clustering of Nominal and Verbal Parameters. A comparison between Romance ad and Chinese ba as used in their respective DOM-constructions shows subtle differences in the clustering of nominal and verbal parameters of markedness in DOM, since while Romance ad is reanalysed as a nominal Case-marker and is hence generalised to all marked object nouns in conformity with the original selectional properties of Latin directional preposition ad, namely animacy, referentiality and affectedness, Chinese ba is merged as a functional head in the verbal domain which selects highly transitive/affective verb phrases in which the lexical verb undergoes head movement and selects delimited objects. The ensuing verbal properties of affectedness in the former and nominal delimitedness in the latter seem to be epiphenomenal, which reveals some subtle microvariations in the clustering of nominal and verbal parameters in DOM, as summarised in the following table:

<table>
<thead>
<tr>
<th>Nominal DOM (e.g. Romance ad)</th>
<th>Verbal DOM (e.g. Chinese ba)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary triggers</td>
<td>Affectedness/transitivity of V</td>
</tr>
<tr>
<td>Human/animate of O</td>
<td>Definiteness/referentiality of O</td>
</tr>
<tr>
<td>Definiteness/referentiality</td>
<td>Affectedness of V</td>
</tr>
<tr>
<td>of O</td>
<td>Delimitedness of O</td>
</tr>
</tbody>
</table>

Table 3. Empirical properties of Romance ad and Chinese ba (cf. Table 1)

DOM, therefore, in spite of its cross-linguistic ubiquity and typological range, is not necessarily a universally homogeneous phenomenon, and a close comparison between Romance ad and Chinese ba seems to uncover some subtle mechanisms at work.
