A short note on honorifics and personal articles in Spanish and Catalan and its consequences for the theory of proper names

Andrés Saab
IIF-SADAF-CONICET & University of Buenos Aires
andres.saab@uba.ar

Abstract: Based on recent findings in Bernstein et al. (2019), regarding the syntactic distribution of personal articles in Catalan and honorifics in Spanish, I propose that they are pure expressives (in Potts’ (2005) sense) that take an entity as argument and return the same entity at the at-issue level and a conventionally implicated proposition in a parallel meaning dimension. If this analysis turns out to be correct, the expressive / proper name interaction in these languages will constitute a new piece of evidence against the predicative analysis of proper names.

In a recent study, Bernstein et al. (2019) show that personal articles denoting familiarity in some varieties of modern Catalan (e.g., en Paco, na Carme, see (1)) and the honorific don/doña denoting respect/formal distance in Spanish (e.g., Doña Ana, Don Luis, see (2)) have the same diachronic origin: the Latin noun dominus, which was used as an honorific title only reserved to the royalty (see (3)).

(1) a. En Pere ha arribat tard.

1 I would like to thank two anonymous reviewers whose comments and criticism were crucial for helping me to strengthen my argument and to clarify many implicit assumptions in the original version. My gratitude extends to Fernando Carranza, Nicolás Lo Guercio, Carlos Muñoz Pérez, Francisco Ordóñez, Francesc Roca, Avel·lina Suñer and Matías Verdecchia. As usual, I am the sole legitimate owner of any mistake or contradiction.

2 Avel·lina Suñer and Francesc Roca point out to me that the en/na alternation is only present in some variants of Balearic Catalan. In colloquial Central Catalan, the definite articles el/la ‘the. MASC/FEM’ are used instead, with exactly the same familiarity effects. In more formal registers of the same dialect and in other registers of northwestern Catalan (e.g., Figueras, Alt Empordà), the alternation is en-l’/la, with the same familiarity effect again. Throughout this squib, I will use the Balearic alternation, but I think that the point I will make generalizes to the alternative alternations in other Catalan dialects. Probably, the same analysis extends to many Spanish dialects as well, in which articles optionally occur with proper names in a very productive way. In my own dialect, for instance, using the definite article with a referential proper name (i.e., not a predicative one, see (13)) also raises the familiarity effect, e.g., Esta tarde voy a ver al Juan ‘This afternoon I will see the.MASC Juan’. Francisco Ordóñez (p.c.) has reported the same uses in other Spanish dialects. He also informs me that in some central Peninsular dialects, there is an asymmetry between masculine and feminine proper names: only feminine names allow for the expressive article with the familiarity effect. Finally, the same asymmetry is attested in some Northern Italian dialects. Even if further research is needed in order to understand many of these patterns, I am pretty convinced that an expressive analysis along the lines to be proposed here for Balearic Catalan would generalize to these other uses of the definite article with proper names in other Romance languages. A first piece of evidence pointing out in this direction is that, for instance, in my own dialect the use of the expressive article is ungrammatical in the plural (i.e., Esta tarde voy a ver a los Juanes ‘This afternoon I will see the.MASC.PL Juanes’ has only a predicative reading, not a referential one).
As for personal articles in Balearic Catalan, Bernstein et al. (2019) discuss a series of intriguing properties regarding their morpho-syntactic distribution. First, unlike regular articles, the personal article only occurs in singular:

(4) a. **Personal article:**
   
<table>
<thead>
<tr>
<th>Article</th>
<th>Plural</th>
</tr>
</thead>
<tbody>
<tr>
<td>en (masc.sg), *ens (masc.pl)</td>
<td>ens (masc.pl)</td>
</tr>
<tr>
<td>na (fem.sg), *nes (fem.pl)</td>
<td>nes (fem.pl)</td>
</tr>
</tbody>
</table>

b. **Definite article:**
   
<table>
<thead>
<tr>
<th>Article</th>
<th>Plural</th>
</tr>
</thead>
<tbody>
<tr>
<td>el (masc.sg), els (masc.pl)</td>
<td>els (masc.pl)</td>
</tr>
<tr>
<td>la (fem.sg), les (fem.pl)</td>
<td>les (fem.pl)</td>
</tr>
</tbody>
</table>

Second, it is strictly adjacent to the name:

(5) a. *en propi Pere
   
<table>
<thead>
<tr>
<th>Article</th>
<th>Plural</th>
</tr>
</thead>
<tbody>
<tr>
<td>PA.MASC</td>
<td>P.</td>
</tr>
<tr>
<td>PA.MASC</td>
<td>P.</td>
</tr>
</tbody>
</table>

b. el propi professor
   
<table>
<thead>
<tr>
<th>Article</th>
<th>Plural</th>
</tr>
</thead>
<tbody>
<tr>
<td>the.MASC</td>
<td>professor</td>
</tr>
<tr>
<td>the.MASC</td>
<td>professor</td>
</tr>
</tbody>
</table>

Third, it disallows restrictive modification:

(6) a. *en Pere que va arribar ahir
   
<table>
<thead>
<tr>
<th>Article</th>
<th>Plural</th>
</tr>
</thead>
<tbody>
<tr>
<td>PA.MASC</td>
<td>P.</td>
</tr>
<tr>
<td>PA.MASC</td>
<td>P.</td>
</tr>
</tbody>
</table>

b. el Pere que va arribar ahir
   
<table>
<thead>
<tr>
<th>Article</th>
<th>Plural</th>
</tr>
</thead>
<tbody>
<tr>
<td>the.MASC</td>
<td>P.</td>
</tr>
<tr>
<td>the.MASC</td>
<td>P.</td>
</tr>
</tbody>
</table>
A very similar distribution is found with the honorific *don/doña* in Spanish when it occurs modifying proper names:3

(7)  *don* (masc.sg), *dones* (masc.pl)
*doña* (fem.sg), *doñas* (fem.pl)

(8)  *don*  mismo  Luis
    HON,MASC  same  Luis

(9)  a.  *don*  Luis  que  llegó  ayer
    HON,MASC  L.  that  arrived  yesterday

b.  el  Luis  que  llegó  ayer
    the  L.  that  arrived  yesterday

‘the Luis who arrived yesterday’
[adapted from Bernstein et al. (2019), p. 91, ex. (12)-(14)]

According to Bernstein et al., this distribution, among other relevant facts, justifies the following syntactic analysis, according to which the personal article in Catalan and the Spanish honorific are low classifiers:4

(10)  \[ DP [D el-la] \ldots [ClassP [Class en-na/don-doña] [\text{NP N}]] \]
     [Bernstein et al. (2019), p. 93, ex. (15)]

I subscribe many of the essential aspects of this approach here, in particular, regarding the conclusion that the personal article and the honorific in each of the relevant languages is generated in a low position as a NP sister. But what about the semantic derivation? At least in a semantic sense, I contend that rather than classifiers, personal articles and honorifics are triggers for conventional implicatures (CI) in a non-at-issue meaning dimension. More concretely, personal articles in modern Catalan and the honorific *doña* in modern Spanish are pure expressives in Potts’ (2005) sense, i.e., functions that take an entity as argument and return the same entity at the at-issue level and a conventionally implicated proposition in a parallel meaning dimension. The relevant axiom under which expressive phrases are interpreted is CI Application, as defined in (11) below (Potts 2005: 64). In this definition, the bullet ● is Potts’ metalogical operator to separate meaning dimensions, the dotted circles indicate optional CI meanings, and the superscripts on the variables for semantic types (τ̆ or τ̂) are used to express meanings in the at-issue dimension or the CI dimension (i.e., the conventional implicature dimension):

---

3 At least in my dialect, there is also a different use of *don/doña* in which the honorific modifies an empty noun, i.e., there is also a pronominal use of *don/doña*. In those cases, pluralization is not impossible (e.g., *Escúchenme, doñas ‘Listen, HON,FEM.PL’*).

4 There are also differences between personal articles in Catalan and Spanish honorifics, but they have more to do with their morpho-phonological status. As argued by Bernstein et al., there are reasons to treat personal articles as clitics.
Conceiving of honorifics in Spanish and personal articles in modern Catalan as pertaining to the class of Potts’ expressives, we can now write the relevant lexical entries. As for the honorific, my proposal is like follows:

Lexical entry for don/doña:

(12) \[ \text{дон/дона} \right\langle e^a, \tau_c^e \rangle = \text{Пропер Наименование}: e^a \bullet \text{Respect}(s^e, \text{Пропер Наименование}): \tau_c^e \]

\[ [s^e = \text{говорящий в контексте}] \]

Now, as for the syntax in which this expressive participates, there are two differences with respect to Bernstein et al.’s original analysis. First, I will use the label ExP (for Expressive Phrase) instead of ClassP, because of the reasons already adduced and the ones we will see in a moment. In principle, given the semantic import that differentiates expressives from classifiers, this is something more than a labeling difference. At any rate, this seems to be a lexical difference, which does not affect the syntactic distribution of these items, which, I assume, is like Bernstein et al. propose. Second, following Saab and Lo Guercio (2019), I contend that referential uses of proper names (e.g., bare proper names in contexts like Anne arrived late) do not project a Number Phrase (NumP). In this respect, bare referential uses contrast with predicative uses of proper names (i.e., The Anne I know arrived late), which do project NumP. Following Acquaviva (2007), Saab and Lo Guercio correlate presence or absence of Num0 with the semantic type of the nominal phrase: \langle e, \tau \rangle or \langle e \rangle type, respectively.

(13)  
\begin{align*}
\text{а. Предикативная Синтаксис (например, The Anne...):} & \quad \text{б. Референциальная Синтаксис (например, Anne):} \\
\text{DP} & \text{DP} \\
\text{D0} & \text{D0} \\
\text{NumP} & \text{NumP} \\
[\text{the}] & [\text{[Ø]}} \\
\sqrt{\text{Anne}} & \sqrt{\text{Anne}} \\
\text{n0} & \text{n0} \\
\text{\[nP_{e}\]} & \text{\[nP_{e}\]} \\
\end{align*}

This analysis aims to capturing the basic fact that in order to being a true nominal predicate, proper names, which start their syntactic-semantic life as denoting in the \( e \) type, need selection by the Num head. Absence of Num0 results in the absolute impossibility for referential uses of proper names to be pluralized:

(14)  
\begin{align*}
\text{а. *Juanes llegaron a la fiesta.} & \quad \text{б. Juan llegó a la fiesta.} \\
\text{J.PL came.3PL to the party} & \text{J.PL came.3PL to the party} \\
\end{align*}
Juan came to the party.

Of course, a predicative use of a proper name can be pluralized because of the presence of a $nP$ selected by a Num head. Presence of Num$^0$ correlates not only with number marking but with the same realization of the D head as in regular DPs, as well:

(15) a. Los Juanes que conozco llegaron a la fiesta.
   ‘The Juanes I know arrived to the party.’
b. El Juan que conozco llegó a la fiesta.
   ‘The Juan I know arrived to the party.’

On this analysis, proper names are either direct referential expressions or mere predicates because of their particular syntactic distribution.

Having clarified the similarities and differences with Bernstein et al.’s analysis, let us see now how the syntax and the semantics of Spanish proper names modified by honorifics looks like once the lexical entry in (12) is assumed:

Syntax and semantics for Spanish honorifics (e.g., Doña Ana):

(16) a. Syntax:

    DP
    /\                    
   D$^0$               ExpP
   /\                  /\   
  Exp$^0$          nP     
      \           /\  
       [doña]  √Ana n$^0$[human, gender]

b. Semantics:

    Ana: e$^a$
    \         .
   Respect(s$^c$, Ana): t$^c$

    doña: <e$^a$, t$^c$>  Ana: e$^a$

The analysis for personal articles in modern Catalan is very similar with a difference in the content of the CI meaning, which I schematically model as a Familiar predicate taking the proper name meaning and the parties of the conversation as arguments. Thus, a reasonable paraphrase for the proposition implicated would be something along these lines: the individual denoted by the proper name is familiar to the interlocutors of the context ($F$ stands for interlocutors):
Lexical entry for personal articles in Catalan

(17) \[ \langle \text{en/na} \rangle <\text{e}^a, \text{t}^c> = \langle \text{Proper Name} \rangle: \text{e}^a \bullet \text{Familiar} (\text{t}^c, \text{Proper Name}): \text{t}^c \]

This entry just formalizes what Bernstein et al. says regarding the familiar meaning that the personal article introduces, which sharply contrasts with the meaning that its counterpart without the article has:

*Familiarity effect:*\(^5\)

(18) a. Chomsky ha publicat un altre llibre. Chomsky has published an other book

b. \textit{En} Chomsky ha publicat un altre llibre.\textit{ART.MASC} Chomsky has published an other book

‘Chomsky has published another book.’

[Bernstein et al. (2019), p. 102, ex. (36)]

In their words:

“The semantic difference between [18a] without a personal article and [18b] with one is that the latter example expresses \textit{pragmatically} the idea that the speaker is familiar with Noam Chomsky. Included is an implicature that the hearer is also familiar with him. This meaning is not the default for [18a], though it is a possible interpretation. Modern Spanish \textit{don/doña}, unlike modern Catalan \textit{en/na}, encodes formality or politeness, and never familiarity.”

[Bernstein et al. (2019), p. 102; my emphasis]

The lexical entry in (17) captures this meaning intuition as a conventional implicature introduced by the expressive article, which takes an individual as argument, returns the same individual at the at-issue level and adds the familiarity conventional implicature at the CI dimension. Note that an important difference with Bernstein et al. is that on my analysis, this expressive meaning is a semantic convention not a pragmatic one.

With the lexical entry in (17) as a starting point, the syntactic and semantic analyses for personal articles follow now in a routinary way:

*Syntax and semantics for personal articles in Modern Catalan (e.g., Na Carme):*

(19) a. *Syntax:*

\[
\begin{array}{c}
\text{DP} \\
\text{D}^0 \\
\text{ExpP} \\
\text{Exp}^0 \\
\text{nP} \\
[\text{na}] \\
\sqrt{\text{Carme}} \\
\text{n}^0_{[\text{human, gender}]} \\
\end{array}
\]

\(^5\) See Brucart (2002) for a similar observation regarding the familiarity effect.
b. **Semantics:**

```
  Familiar(F , Carme): f'
  na: <e', f'>
  Carme: e'
```

Crucial evidence in favor of an expressive analysis for Spanish honorifics and personal articles in modern Catalan is that they pass all the tests that diagnose expressivity at the CI dimension (see Potts 2005). Let us focus on hyper-projectability and speaker-oriented tests, which are among the more robust diagnostic for expressivity:

**Spanish:**

(20)  

<p>| | | | | | | | | |</p>
<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
</table>
| a. Ana cree que don Luis no viene a la fiesta. | A. believes that HON,MASC L. not comes to the party.
| b. Ana no vio a don Luis. | A. not saw DOM HON,MASC L.
| c. ¿Vio a don Luis Ana? | saw DOM HON,MASC L. A.
| d. Si don Luis está solo, sería bueno visitarlo. | if HON,MASC L. is alone, would be good visit.$\text{INF=HIM}$

**Balearic Catalan:**

(21)  

<p>| | | | | | | | | |</p>
<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>

| a. N’Anna creu que na Carme ha arribat tard. | PA,FEM=A. believes that PA,FEM C. has arrived late
| b. N’Anna no va veure en Lluís. | PA,FEM=A. not AUX see.$\text{INF ART,MASC}$ L.
| c. Va veure en Lluís, n’Anna? | AUX see.$\text{INF}$ PA,MASC L. PA,FEM=A.
| d. Si en Lluís està sol, seria bo visitar-lo. | if PA,MASC L. is alone would be good visit.$\text{INF-HIM}$

---

6 I am thankful to Francesc Roca and Avel·lina Suñer for their judgments and help with the Catalan examples. As noted in footnote 2, these examples only correspond to Balearic Catalan, but the same hyper-projectability effects plus the speaker-oriented meaning are attested in central and northwestern varieties but with the **el/là** alternation and the **en-l’/la** alternation respectively.
‘If Lluís is alone, it would be good to visit him.’

The examples in (20a) and (21a) demonstrate (i) that familiarity/honorific meanings project out of the propositional attitude predicate, and (ii) that both meanings are speaker-oriented, i.e., it cannot be the case that the respect or the familiarity meanings are not attributed to the speaker of the context or the interlocutors of the speech act. Similar results obtain in (20-21b), (20-21c) and (20-21d). Hyper-projectability effects are straightforwardly captured under Potts’ bidimensional logic, which is indeed particularly designed for accounting for those effects. In a nutshell, meaning pertaining to the at-issue dimension like those introduced by truth-conditional operators cannot affect meaning pertaining to the CI-dimension. In turn, the speaker-oriented property is an intrinsic convention of expressive items and, as such, must be modeled in the lexicon, as I did with the lexical entry in (12).

The proposed syntactic and semantic analyses derive the three particularities of personal articles in Catalan and Spanish honorifics found in Bernstein et al. First, their incompatibility with pluralization (see (4) and (7)) follows from the very nature of proper names as numberless DPs, exactly as proposed for independent reasons in Saab and Lo Guercio (see the tree in (13b)). Second, the adjacency effects in both languages (see (5) and (8)) are captured in the same way as in Bernstein et al., i.e., from the merge position of this sort of expressives as strict nP sisters. In this respect, Bernstein et al.’s finding is a particularly important one, since it forces us to give up the common idea that personal articles in Catalan are D projections (see, for instance, Matushansky 2006). Note that related to this, taking personal articles and honorifics as pertaining to the class of Potts’ expressives adds a clear motivation for why they have the particular syntactic distribution noticed by Bernstein et al. Concretely, the expressive and the proper name in Spanish and Catalan have to be in the required sisterhood relation that feeds CI Application (see (12)). Finally, absence of restrictive modification is directly captured under an analysis in which proper names are not predicates, but direct referential expressions. Therefore, the ungrammaticalities in (6a) and (9a) are fully reduced to the impossibility of restrictive modification with bare proper names (e.g., *Anne I know arrived late). In order for restrictive modification to be allowed, the proper name has first to be converted into a predicate by the introduction of a Number head, like in examples (6b) and (9b), in which the presence of true determiners is correlated with presence of a NumP projection (cfr. (9b) with los Luises que llegaron ayer ‘the.PL Luis.PL who arrived yesterday’).

Now, if what I have proposed here turns out to be correct, the syntax and semantics of personal articles in Catalan and Spanish honorifics would constitute another important piece of evidence against the predicative analysis of proper names (see, in particular, Matushansky 2006, 2008). In effect, on my analysis, personal articles in Catalan and Spanish honorifics are expressive functors taking entity denoting expressions as arguments. This approach directly explains why, then, honorifics and personal articles are fully incompatible with true predicates denoting in <e,t> (or <s,<e,t>>):

(22) a. *Llegó el don médico.  ‘The doctor arrived.’
   arrived the HON.MASC doctor
   Llegó el médico.  ‘The doctor arrived.’

 b. Va arribar el/*en profesor.  ‘The professor arrived.’
   AUX. arrive.INF. the.MASC/PA.MASC professor
For all the reasons adduced in this note, it is evident that if proper names were predicates, the pattern briefly discussed here would remain mysterious.

Before concluding, let me comment on three important observations made by two anonymous reviewers. First, as noted by one of them, both don/doña and en/na are compatible with common names, but with interesting restrictions. Here are some Spanish examples:

(23)  

<table>
<thead>
<tr>
<th>dona</th>
<th>calores,</th>
<th>don</th>
<th>risitas…</th>
</tr>
</thead>
<tbody>
<tr>
<td>HON,FEM</td>
<td>heats</td>
<td>HON,MASC</td>
<td>giggles</td>
</tr>
</tbody>
</table>

[Reviewer’s examples]

Interestingly, on these uses, don/doña must be interpreted as uses of a given proper name, in which the property expressed by the common noun is taken as a distinctive trait of the individual, in a way similar to nicknames (e.g., El Pulga ‘the Flea[masc]’, La Mona ‘The Monkey[fem]’). As the reviewer points out, the argument against the predicative analysis still holds. Yet I think that we can strengthen the reviewer’s point even further by saying that the facts can be taken as giving further support to the proposed analysis: in order to be licitly combined with don/doña, a common noun has first to be syntactically converted into a proper name, which in Saab and Lo Guercio’s approach means to force such a common noun to participate in a numberless DP like (13b).

Another reviewer makes the observation that “on the notion of proper names as a numberless DP, which presumably would derive the lack of plural instances of en/na or don/doña, it is not completely obvious why the mechanism that derives los Alfredos is not available for deriving *dones Alfredos.” The claim that dones Alfredos ‘Mr. Alfreds’ is impossible is correct, but let me add that in order to get a plural proper name, an instance of Num⁰ must be added to the internal structure of a given proper name. As we already know, adding Num⁰ results, in turn, in a regular DP structure in which the D head must be overtly realized (at least, under the definite reading). So, the relevant minimal pair would be as follows:

(24)  

a. Los Alfredo(s) que conozco llegaron tarde.
   ‘The Alfreds I know arrived late.’

b. Los dones Alfredo(s) que conozco llegaron tarde.
   ‘The Mr. Alfreds I know arrived late.’

So, the reviewer’s point still holds, which is in fact a very welcome result for my analysis here and Saab and Lo Guercio’s general approach to the syntax and semantics of proper names. The reason is simple: merging Num⁰ right above nP converts this nP into a property of the <e,t> type (i.e., a semantic predicate of some sort). The resulting semantic object is not a suitable semantic argument for the don/doña expressive functor, which requires a semantic object of the e type, not of the <e,t> one. That is to say, the ungrammaticality of (24b) follows as a type mismatch, transparently predicted by the proposal made here.

Finally, the same reviewer correctly points out that “it would be useful to explore examples like (25), where the CI contribution by maldita ‘damn’ seems to contradict that of doña, a somewhat unexpected possibility if both are speaker-oriented”:
Note first that the example seems to challenge what I have just said with respect to the impossibility of (24b), namely, that *don/doña* cannot occur in a predicative context (see (13a)). Keep this in mind and, for the time being, accept the reviewer’s claim that we indeed have two expressives interacting in the environment of a proper name. My first reaction to this is that even putting aside possible ironic uses, there is no incompatibility between the two meanings: one can show distance or respect to someone without implicating that one likes such a person.⁷

However, beyond this possible objection and my reaction above, the reviewer’s example is relevant in other respects as well, since it highlights putative licit interactions between different types of expressives and bears, consequently, on the main thesis of this squib, namely, that personal articles and honorifics take individuals as arguments, not properties. Therefore, the next point to notice regarding such potential interaction is that *maldita*, which essentially behaves like English *damn* in the relevant respects (see Saab and Carranza 2021), should not combine with proper names. This is so, because as discussed at length by Potts, expressives of the *damn* type take properties as arguments, not entities, and return a conventionally implicated proposition expressed through Potts’ *BAD* function, which is vaguely translated as the function stating that “the speaker is in a heightened emotional state regarding X”, where X is the plural individual composed of all members of the input set (see Potts 2005: 167-168). To see how expressives of the *damn* type work, consider the following syntax for a Spanish expressive DP like *los malditos neoliberales* ‘the damn neoliberals’:

![Diagram of DP structure](image_url)

It seems then that these expressives are in complementary distribution with honorifics regarding the type of argument each can take. Put differently, assuming with Potts that *maldito* denotes in

---

⁷ I am shameless simplifying the picture here in order to reconstruct the reviewer’s argument. As is well-known, pure expressives of the *damn* type introduce important complications for a strict compositional analysis of sentences containing such expressives. The problem is easy to pinpoint: if one says *I do not find the damn keys!*, one is not in a particular heightened emotional state regarding the relevant keys, but regarding the whole event. This problem is dubbed *argument extension* in Gutzmann (2019), a terminological decision that makes clear reference to the intriguing fact that the semantic arguments of such expressives do not necessarily correspond to their syntactic arguments. I refer the reader to Gutzmann for an attempt to reconcile argument extension effects with compositionality.
\(<\mathbf{e^a}, \mathbf{t}^e>, \mathbf{t}^e\) (i.e., it takes an \(<\mathbf{e}, \mathbf{t}>\) argument at the at-issue dimension and returns the same argument plus a CI meaning), the relevant interpretative axiom is CI Application, like in the case of honorifics and personal articles, with the already noticed difference in the semantic type of the argument for the functor:

(27) \[
\begin{array}{c}
\text{neoliberales: } \langle \mathbf{e^a}, \mathbf{t}^e \rangle \\
\text{malditos(neoliberales): } \mathbf{t}^e
\end{array}
\]

[modeled after Potts 2005: 166]

Taking both Potts’s approach to pure expressives and my own analysis for Spanish honorifics for granted, the prediction is straightforward: the expressive \textit{maldito} cannot take referential proper names as arguments. And this is borne out:

(28) \*[ (Maldita) Ana (maldita)] llegó.

damn A. damn arrived

Therefore, for a proper name root to be combined with this type of expressives, the proper name has first to be converted into a predicate by the presence of a \(n\P\)-selecting Num head, which is exactly what happens with the reviewer’s example in (25). But if this the case, then the string \textit{doña Ana} has to be reanalyzed as a unit interpreted as a metalinguistic predicate, roughly of the form \textit{person referred as “doña Ana”}.\footnote{Note that this metalinguistic predicate must be distinguished from the original naming predicate, since the individual \textit{Ana} is called “Ana” not “Doña Ana”. But of course, the relevant individual can be referred in other ways, one of which is which is “Doña Ana”.} It is to this complex object that \textit{maldita} applies for outputting an expressive nominal phrase that introduces a conventionally implicated meaning, also roughly paraphrased as the proposition that \textit{the speaker is in a heightened emotional state regarding the individual referred as “doña Ana”}. I think that this meaning is intuitively correct, in which case the reviewer’s example in (25) is not about combining two expressives with a proper name, but just one, \textit{maldita}, which combines with a metalinguistic predicate formed through the presence of a Num head in the underlying structure.\footnote{However, as Nicolás Lo Guercio notes, we cannot entirely reject a different analysis in which we have indeed two expressives, \textit{mal"{a}dita} and \textit{don}, but combined in a different syntactic structure. Concretely, he suggests that there is not implausible an alternative analysis similar to the one that underlies English expressive nominals like \textit{that damn John}. I agree. Perhaps, the more reasonable alternative compatible with my assumptions here is to analyze these particular uses of expressives like epithets and not like expressive attributive adjectives (EAs). As Potts (2005) shows in detail, epithets, unlike EAs, take individuals as semantic arguments, not properties. Yet, in the general case, Spanish epithets, unlike English ones, require that their \(e\)-denoting argument surfaces with the preposition \textit{de}’of” like in el maldito de Juan lit. ‘The damn of Juan’. Still, it is plausible to give an appositive analysis to el maldito Juan, according to which we combine the phrase containing the epithet with the proper name in an appositive relation (e.g., [\(\text{DP} \ [\text{DP el maldito} [n\P \emptyset]] \ [\text{DP Juan}]]\)). I cannot develop this analytical option here and (dis)confirm it through empirical evidence. This will then a topic for future research. For a recent analysis of epithets in Spanish, see Saab and Carranza (2021, chapter 12) and Orlando and Saab (in press).}
for the string *doña Ana* as it occurs in (25) comes from the grammatical alternative to (24b), which basically consists of enclosing the string *don Alfredo* under quotative marks:

(29) Los “*don Alfredo*” que conozco llegaron tarde.
    The.pl HON.PL Alfred that know.1sg arrived late
    ‘The “Mr. Alfred” I know arrived late.’

As Nicolás Lo Guercio (p.c.) correctly points out, that something along these lines is on the right track is further confirmed by the fact that the honorific meaning is fully absent in this example. The clear intuition is that the speaker is talking about individuals who are referred as “*don Alfredo*”, not that the speaker respects such individual. Period. Therefore, it has to be the case that the string *don Alfredo* is affected as a unit by the quotation marks.

In sum, the particular interaction among different types of expressives show that an analysis along the lines proposed in this squib, according to which referential and predicative uses of proper names crucially depends on the absence or presence of functional structure within DPs, seems to be essentially on the right track and makes sense of what otherwise looks like a curious casuistic. In this respect, I have shown that the curious distribution of personal articles in modern Catalan and Spanish honorifics are ideal candidates to isolate referential uses of proper name, which cannot have an underlying predicative structure, but a referential one.
